### 9.2.7 Authoring notes §<sup>p11</sup><sub>97</sub>

Legacy proxy servers are known to, in certain cases, drop HTTP connections after a short timeout. To protect against such proxy servers, authors can include a comment line (one starting with a ':' character) every 15 seconds or so.

Authors wishing to relate event source connections to each other or to specific documents previously served might find that relying on IP addresses doesn't work, as individual clients can have multiple IP addresses (due to having multiple proxy servers) and individual IP addresses can have multiple clients (due to sharing a proxy server). It is better to include a unique identifier in the document when it is served and then pass that identifier as part of the URL when the connection is established.

Authors are also cautioned that HTTP chunking can have unexpected negative effects on the reliability of this protocol, in particular if the chunking is done by a different layer unaware of the timing requirements. If this is a problem, chunking can be disabled for serving event streams.

Clients that support HTTP's per-server connection limitation might run into trouble when opening multiple pages from a site if each page has an [EventSource<sup>p1191</sup>](#) to the same domain. Authors can avoid this using the relatively complex mechanism of using unique domain names per connection, or by allowing the user to enable or disable the [EventSource<sup>p1191</sup>](#) functionality on a per-page basis, or by sharing a single [EventSource<sup>p1191</sup>](#) object using a [shared worker<sup>p1230</sup>](#).

### 9.2.8 Connectionless push and other features §<sup>p11</sup><sub>97</sub>

User agents running in controlled environments, e.g. browsers on mobile handsets tied to specific carriers, may offload the management of the connection to a proxy on the network. In such a situation, the user agent for the purposes of conformance is

considered to include both the handset software and the network proxy.

#### Example

For example, a browser on a mobile device, after having established a connection, might detect that it is on a supporting network and request that a proxy server on the network take over the management of the connection. The timeline for such a situation might be as follows:

1. Browser connects to a remote HTTP server and requests the resource specified by the author in the [EventSource](#)<sup>p1192</sup> constructor.
2. The server sends occasional messages.
3. In between two messages, the browser detects that it is idle except for the network activity involved in keeping the TCP connection alive, and decides to switch to sleep mode to save power.
4. The browser disconnects from the server.
5. The browser contacts a service on the network, and requests that the service, a "push proxy", maintain the connection instead.
6. The "push proxy" service contacts the remote HTTP server and requests the resource specified by the author in the [EventSource](#)<sup>p1192</sup> constructor (possibly including a `Last-Event-ID`<sup>p1194</sup> HTTP header, etc.).
7. The browser allows the mobile device to go to sleep.
8. The server sends another message.
9. The "push proxy" service uses a technology such as OMA push to convey the event to the mobile device, which wakes only enough to process the event and then returns to sleep.

This can reduce the total data usage, and can therefore result in considerable power savings.

As well as implementing the existing API and [text/event-stream](#)<sup>p1449</sup> wire format as defined by this specification and in more distributed ways as described above, formats of event framing defined by [other applicable specifications](#)<sup>p73</sup> may be supported. This specification does not define how they are to be parsed or processed.

### 9.2.9 Garbage collection §<sup>p11</sup><sub>98</sub>

While an [EventSource](#)<sup>p1191</sup> object's [readyState](#)<sup>p1193</sup> is [CONNECTING](#)<sup>p1193</sup>, and the object has one or more event listeners registered for [open](#)<sup>p1472</sup>, [message](#)<sup>p1471</sup> or [error](#)<sup>p1471</sup> events, there must be a strong reference from the [Window](#)<sup>p922</sup> or [WorkerGlobalScope](#)<sup>p1228</sup> object that the [EventSource](#)<sup>p1191</sup> object's constructor was invoked from to the [EventSource](#)<sup>p1191</sup> object itself.

While an [EventSource](#)<sup>p1191</sup> object's [readyState](#)<sup>p1193</sup> is [OPEN](#)<sup>p1193</sup>, and the object has one or more event listeners registered for [message](#)<sup>p1471</sup> or [error](#)<sup>p1471</sup> events, there must be a strong reference from the [Window](#)<sup>p922</sup> or [WorkerGlobalScope](#)<sup>p1228</sup> object that the [EventSource](#)<sup>p1191</sup> object's constructor was invoked from to the [EventSource](#)<sup>p1191</sup> object itself.

While there is a task queued by an [EventSource](#)<sup>p1191</sup> object on the [remote event task source](#)<sup>p1194</sup>, there must be a strong reference from the [Window](#)<sup>p922</sup> or [WorkerGlobalScope](#)<sup>p1228</sup> object that the [EventSource](#)<sup>p1191</sup> object's constructor was invoked from to that [EventSource](#)<sup>p1191</sup> object.

If a user agent is to **forcibly close** an [EventSource](#)<sup>p1191</sup> object (this happens when a [Document](#)<sup>p130</sup> object goes away permanently), the user agent must abort any instances of the [fetch](#) algorithm started for this [EventSource](#)<sup>p1191</sup> object, and must set the [readyState](#)<sup>p1193</sup> attribute to [CLOSED](#)<sup>p1193</sup>.

If an [EventSource](#)<sup>p1191</sup> object is garbage collected while its connection is still open, the user agent must abort any instance of the [fetch](#) algorithm opened by this [EventSource](#)<sup>p1191</sup>.

### 9.2.10 Implementation advice §<sup>p11</sup><sub>98</sub>

*This section is non-normative.*

User agents are strongly urged to provide detailed diagnostic information about [EventSource<sup>p1191</sup>](#) objects and their related network connections in their development consoles, to aid authors in debugging code using this API.

For example, a user agent could have a panel displaying all the [EventSource<sup>p1191</sup>](#) objects a page has created, each listing the constructor's arguments, whether there was a network error, what the CORS status of the connection is and what headers were sent by the client and received from the server to lead to that status, the messages that were received and how they were parsed, and so forth.

Implementations are especially encouraged to report detailed information to their development consoles whenever an [error<sup>p1471</sup>](#) event is fired, since little to no information can be made available in the events themselves.

## 9.3 Cross-document messaging <sup>§ p1199</sup>

Web browsers, for security and privacy reasons, prevent documents in different domains from affecting each other; that is, cross-site scripting is disallowed.

While this is an important security feature, it prevents pages from different domains from communicating even when those pages are not hostile. This section introduces a messaging system that allows documents to communicate with each other regardless of their source domain, in a way designed to not enable cross-site scripting attacks.

### Note

The [postMessage\(\)<sup>p1201</sup>](#) API can be used as a [tracking vector](#).

### 9.3.1 Introduction <sup>§ p1199</sup>

*This section is non-normative.*

### Example

For example, if document A contains an [iframe<sup>p390</sup>](#) element that contains document B, and script in document A calls [postMessage\(\)<sup>p1201</sup>](#) on the [Window<sup>p922</sup>](#) object of document B, then a message event will be fired on that object, marked as originating from the [Window<sup>p922</sup>](#) of document A. The script in document A might look like:

```
var o = document.getElementsByTagName('iframe')[0];
o.contentWindow.postMessage('Hello world', 'https://b.example.org/');
```

To register an event handler for incoming events, the script would use `addEventListener()` (or similar mechanisms). For example, the script in document B might look like:

```
window.addEventListener('message', receiver, false);
function receiver(e) {
  if (e.origin == 'https://example.com') {
    if (e.data == 'Hello world') {
      e.source.postMessage('Hello', e.origin);
    } else {
      alert(e.data);
    }
  }
}
```

This script first checks the domain is the expected domain, and then looks at the message, which it either displays to the user, or responds to by sending a message back to the document which sent the message in the first place.

## 9.3.2 Security § p12 00

### 9.3.2.1 Authors § p12 00

#### ⚠Warning!

**Use of this API requires extra care to protect users from hostile entities abusing a site for their own purposes.**

Authors should check the [origin](#)<sup>p1190</sup> attribute to ensure that messages are only accepted from domains that they expect to receive messages from. Otherwise, bugs in the author's message handling code could be exploited by hostile sites.

Furthermore, even after checking the [origin](#)<sup>p1190</sup> attribute, authors should also check that the data in question is of the expected format. Otherwise, if the source of the event has been attacked using a cross-site scripting flaw, further unchecked processing of information sent using the [postMessage\(\)](#)<sup>p1201</sup> method could result in the attack being propagated into the receiver.

Authors should not use the wildcard keyword (\*) in the *targetOrigin* argument in messages that contain any confidential information, as otherwise there is no way to guarantee that the message is only delivered to the recipient to which it was intended.

Authors who accept messages from any origin are encouraged to consider the risks of a denial-of-service attack. An attacker could send a high volume of messages; if the receiving page performs expensive computation or causes network traffic to be sent for each such message, the attacker's message could be multiplied into a denial-of-service attack. Authors are encouraged to employ rate limiting (only accepting a certain number of messages per minute) to make such attacks impractical.

### 9.3.2.2 User agents § p12 00

The integrity of this API is based on the inability for scripts of one [origin](#)<sup>p898</sup> to post arbitrary events (using `dispatchEvent()` or otherwise) to objects in other origins (those that are not the [same](#)<sup>p899</sup>).

#### Note

*Implementers are urged to take extra care in the implementation of this feature. It allows authors to transmit information from one domain to another domain, which is normally disallowed for security reasons. It also requires that UAs be careful to allow access to certain properties but not others.*

User agents are also encouraged to consider rate-limiting message traffic between different [origins](#)<sup>p898</sup>, to protect naïve sites from denial-of-service attacks.

## 9.3.3 Posting messages § p12 00

#### For web developers (non-normative)

**`window.postMessage`**<sup>p1201</sup>(*message* [, *options* ])

Posts a message to the given window. Messages can be structured objects, e.g. nested objects and arrays, can contain JavaScript values (strings, numbers, [Date](#) objects, etc.), and can contain certain data objects such as [File Blob](#), [FileList](#), and [ArrayBuffer](#) objects.

Objects listed in the [transfer](#)<sup>p1205</sup> member of *options* are transferred, not just cloned, meaning that they are no longer usable on the sending side.

A target origin can be specified using the [targetOrigin](#)<sup>p923</sup> member of *options*. If not provided, it defaults to `"/"`. This default restricts the message to same-origin targets only.

If the origin of the target window doesn't match the given target origin, the message is discarded, to avoid information leakage. To send the message to the target regardless of origin, set the target origin to `"*"`.

Throws a [DataCloneError](#) `DOMException` if *transfer* array contains duplicate objects or if *message* could not be cloned.

**`window.postMessage`**<sup>p1201</sup>(*message*, *targetOrigin* [, *transfer* ])

This is an alternate version of [postMessage\(\)](#)<sup>p1201</sup> where the target origin is specified as a parameter. Calling `window.postMessage(message, target, transfer)` is equivalent to `window.postMessage(message, {targetOrigin, transfer})`.

## Note

When posting a message to a [Window](#)<sup>p922</sup> of a [browsing context](#)<sup>p998</sup> that has just been navigated to a new [Document](#)<sup>p138</sup> is likely to result in the message not receiving its intended recipient: the scripts in the target [browsing context](#)<sup>p998</sup> have to have had time to set up listeners for the messages. Thus, for instance, in situations where a message is to be sent to the [Window](#)<sup>p922</sup> of newly created child [iframe](#)<sup>p390</sup>, authors are advised to have the child [Document](#)<sup>p138</sup> post a message to their parent announcing their readiness to receive messages, and for the parent to wait for this message before beginning posting messages.

The **window post message steps**, given a *targetWindow*, *message*, and *options*, are as follows:

1. Let *targetRealm* be *targetWindow*'s [realm](#)<sup>p1077</sup>.
2. Let *incumbentSettings* be the [incumbent settings object](#)<sup>p1081</sup>.
3. Let *targetOrigin* be *options*["[targetOrigin](#)<sup>p923</sup>"].
4. If *targetOrigin* is a single U+002F SOLIDUS character (/), then set *targetOrigin* to *incumbentSettings*'s [origin](#)<sup>p1076</sup>.
5. Otherwise, if *targetOrigin* is not a single U+002A ASTERISK character (\*), then:
  1. Let *parsedURL* be the result of running the [URL parser](#) on *targetOrigin*.
  2. If *parsedURL* is failure, then throw a "[SyntaxError](#)" [DOMException](#).
  3. Set *targetOrigin* to *parsedURL*'s [origin](#).
6. Let *transfer* be *options*["[transfer](#)<sup>p1205</sup>"].
7. Let *serializeWithTransferResult* be [StructuredSerializeWithTransfer](#)<sup>p125</sup>(*message*, *transfer*). Rethrow any exceptions.
8. [Queue a global task](#)<sup>p1125</sup> on the **posted message task source** given *targetWindow* to run the following steps:
  1. If the *targetOrigin* argument is not a single literal U+002A ASTERISK character (\*) and *targetWindow*'s [associated Document](#)<sup>p923</sup>'s [origin](#) is not [same origin](#)<sup>p899</sup> with *targetOrigin*, then return.
  2. Let *origin* be the [serialization](#)<sup>p898</sup> of *incumbentSettings*'s [origin](#)<sup>p1076</sup>.
  3. Let *source* be the [WindowProxy](#)<sup>p934</sup> object corresponding to *incumbentSettings*'s [global object](#)<sup>p1077</sup> (a [Window](#)<sup>p922</sup> object).
  4. Let *deserializeRecord* be [StructuredDeserializeWithTransfer](#)<sup>p127</sup>(*serializeWithTransferResult*, *targetRealm*).  
If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1472</sup> at *targetWindow*, using [MessageEvent](#)<sup>p1189</sup>, with the [origin](#)<sup>p1190</sup> attribute initialized to *origin* and the [source](#)<sup>p1190</sup> attribute initialized to *source*, and then return.
  5. Let *messageClone* be *deserializeRecord*.[[Deserialized]].
  6. Let *newPorts* be a new [frozen array](#) consisting of all [MessagePort](#)<sup>p1205</sup> objects in *deserializeRecord*.[[TransferredValues]], if any, maintaining their relative order.
  7. [Fire an event](#) named [message](#)<sup>p1471</sup> at *targetWindow*, using [MessageEvent](#)<sup>p1189</sup>, with the [origin](#)<sup>p1190</sup> attribute initialized to *origin*, the [source](#)<sup>p1190</sup> attribute initialized to *source*, the [data](#)<sup>p1189</sup> attribute initialized to *messageClone*, and the [ports](#)<sup>p1190</sup> attribute initialized to *newPorts*.

The [Window](#)<sup>p922</sup> interface's **postMessage(*message*, *options*)** method steps are to run the [window post message steps](#)<sup>p1201</sup> given *this*, *message*, and *options*.

The [Window](#)<sup>p922</sup> interface's **postMessage(*message*, *targetOrigin*, *transfer*)** method steps are to run the [window post message steps](#)<sup>p1201</sup> given *this*, *message*, and «[ "[targetOrigin](#)<sup>p923</sup>" → *targetOrigin*, "[transfer](#)<sup>p1205</sup>" → *transfer* ]».

## 9.4 Channel messaging <sup>§ p1202</sup>

### 9.4.1 Introduction <sup>§ p1202</sup>

*This section is non-normative.*

To enable independent pieces of code (e.g. running in different [browsing contexts](#)<sup>p998</sup>) to communicate directly, authors can use [channel messaging](#)<sup>p1202</sup>.

Communication channels in this mechanism are implemented as two-ways pipes, with a port at each end. Messages sent in one port are delivered at the other port, and vice-versa. Messages are delivered as DOM events, without interrupting or blocking running [tasks](#)<sup>p1124</sup>.

To create a connection (two "entangled" ports), the `MessageChannel()` constructor is called:

```
var channel = new MessageChannel();
```

One of the ports is kept as the local port, and the other port is sent to the remote code, e.g. using [postMessage\(\)](#)<sup>p1201</sup>:

```
otherWindow.postMessage('hello', 'https://example.com', [channel.port2]);
```

To send messages, the [postMessage\(\)](#)<sup>p1208</sup> method on the port is used:

```
channel.port1.postMessage('hello');
```

To receive messages, one listens to [message](#)<sup>p1471</sup> events:

```
channel.port1.onmessage = handleMessage;
function handleMessage(event) {
  // message is in event.data
  // ...
}
```

Data sent on a port can be structured data; for example here an array of strings is passed on a [MessagePort](#)<sup>p1205</sup>:

```
port1.postMessage(['hello', 'world']);
```

#### 9.4.1.1 Examples <sup>§ p1202</sup>

*This section is non-normative.*

##### Example

In this example, two JavaScript libraries are connected to each other using [MessagePort](#)<sup>p1205</sup>s. This allows the libraries to later be hosted in different frames, or in [Worker](#)<sup>p1236</sup> objects, without any change to the APIs.

```
<script src="contacts.js"></script> <!-- exposes a contacts object -->
<script src="compose-mail.js"></script> <!-- exposes a composer object -->
<script>
  var channel = new MessageChannel();
  composer.addContactsProvider(channel.port1);
  contacts.registerConsumer(channel.port2);
</script>
```

Here's what the "addContactsProvider()" function's implementation could look like:

```
function addContactsProvider(port) {
  port.onmessage = function (event) {
    switch (event.data.messageType) {
      case 'search-result': handleSearchResult(event.data.results); break;
      case 'search-done': handleSearchDone(); break;
      case 'search-error': handleSearchError(event.data.message); break;
      // ...
    }
  };
};
```

Alternatively, it could be implemented as follows:

```
function addContactsProvider(port) {
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-result')
      handleSearchResult(event.data.results);
  });
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-done')
      handleSearchDone();
  });
  port.addEventListener('message', function (event) {
    if (event.data.messageType == 'search-error')
      handleSearchError(event.data.message);
  });
  // ...
  port.start();
};
```

The key difference is that when using `addEventListener()`, the `start()`<sup>p1208</sup> method must also be invoked. When using `onmessage`<sup>p1205</sup>, the call to `start()`<sup>p1208</sup> is implied.

The `start()`<sup>p1208</sup> method, whether called explicitly or implicitly (by setting `onmessage`<sup>p1205</sup>), starts the flow of messages: messages posted on message ports are initially paused, so that they don't get dropped on the floor before the script has had a chance to set up its handlers.

#### 9.4.1.2 Ports as the basis of an object-capability model on the web <sup>§p1203</sup>

*This section is non-normative.*

Ports can be viewed as a way to expose limited capabilities (in the object-capability model sense) to other actors in the system. This can either be a weak capability system, where the ports are merely used as a convenient model within a particular origin, or as a strong capability model, where they are provided by one origin *provider* as the only mechanism by which another origin *consumer* can effect change in or obtain information from *provider*.

For example, consider a situation in which a social web site embeds in one `iframe`<sup>p390</sup> the user's email contacts provider (an address book site, from a second origin), and in a second `iframe`<sup>p390</sup> a game (from a third origin). The outer social site and the game in the second `iframe`<sup>p390</sup> cannot access anything inside the first `iframe`<sup>p390</sup>; together they can only:

- `Navigate`<sup>p1014</sup> the `iframe`<sup>p390</sup> to a new `URL`, such as the same `URL` but with a different `fragment`, causing the `Window`<sup>p922</sup> in the `iframe`<sup>p390</sup> to receive a `hashchange`<sup>p1471</sup> event.
- Resize the `iframe`<sup>p390</sup>, causing the `Window`<sup>p922</sup> in the `iframe`<sup>p390</sup> to receive a `resize` event.
- Send a `message`<sup>p1471</sup> event to the `Window`<sup>p922</sup> in the `iframe`<sup>p390</sup> using the `window.postMessage()`<sup>p1201</sup> API.

The contacts provider can use these methods, most particularly the third one, to provide an API that can be accessed by other origins to manipulate the user's address book. For example, it could respond to a message "add-contact Guillaume Tell

<tel@pomme.example.net>" by adding the given person and email address to the user's address book.

To avoid any site on the web being able to manipulate the user's contacts, the contacts provider might only allow certain trusted sites, such as the social site, to do this.

Now suppose the game wanted to add a contact to the user's address book, and that the social site was willing to allow it to do so on its behalf, essentially "sharing" the trust that the contacts provider had with the social site. There are several ways it could do this; most simply, it could just proxy messages between the game site and the contacts site. However, this solution has a number of difficulties: it requires the social site to either completely trust the game site not to abuse the privilege, or it requires that the social site verify each request to make sure it's not a request that it doesn't want to allow (such as adding multiple contacts, reading the contacts, or deleting them); it also requires some additional complexity if there's ever the possibility of multiple games simultaneously trying to interact with the contacts provider.

Using message channels and [MessagePort](#)<sup>p1205</sup> objects, however, all of these problems can go away. When the game tells the social site that it wants to add a contact, the social site can ask the contacts provider not for it to add a contact, but for the *capability* to add a single contact. The contacts provider then creates a pair of [MessagePort](#)<sup>p1205</sup> objects, and sends one of them back to the social site, who forwards it on to the game. The game and the contacts provider then have a direct connection, and the contacts provider knows to only honor a single "add contact" request, nothing else. In other words, the game has been granted the capability to add a single contact.

#### 9.4.1.3 Ports as the basis of abstracting out service implementations § p1204

*This section is non-normative.*

Continuing the example from the previous section, consider the contacts provider in particular. While an initial implementation might have simply used [XMLHttpRequest](#) objects in the service's [iframe](#)<sup>p390</sup>, an evolution of the service might instead want to use a [shared worker](#)<sup>p1237</sup> with a single [WebSocket](#) connection.

If the initial design used [MessagePort](#)<sup>p1205</sup> objects to grant capabilities, or even just to allow multiple simultaneous independent sessions, the service implementation can switch from the [XMLHttpRequest](#)s-in-each-[iframe](#)<sup>p390</sup> model to the shared-[WebSocket](#) model without changing the API at all: the ports on the service provider side can all be forwarded to the shared worker without it affecting the users of the API in the slightest.

#### 9.4.2 Message channels § p1204

```
IDL
[Exposed=(Window,Worker)]
interface MessageChannel {
  constructor();

  readonly attribute MessagePort port1;
  readonly attribute MessagePort port2;
};
```

For web developers (non-normative)

**channel** = new [MessageChannel](#)<sup>p1204</sup>()

Returns a new [MessageChannel](#)<sup>p1204</sup> object with two new [MessagePort](#)<sup>p1205</sup> objects.

**channel.port1**<sup>p1205</sup>

Returns the first [MessagePort](#)<sup>p1205</sup> object.

**channel.port2**<sup>p1205</sup>

Returns the second [MessagePort](#)<sup>p1205</sup> object.

A [MessageChannel](#)<sup>p1204</sup> object has an associated **port 1** and an associated **port 2**, both [MessagePort](#)<sup>p1205</sup> objects.

The new [MessageChannel](#)() constructor steps are:

1. Set [this](#)'s [port 1](#)<sup>p1204</sup> to a new [MessagePort](#)<sup>p1205</sup> in [this](#)'s [relevant realm](#)<sup>p1083</sup>.

- Set [this's port 2](#)<sup>p1204</sup> to a new [MessagePort](#)<sup>p1205</sup> in [this's relevant realm](#)<sup>p1083</sup>.
- [Entangle](#)<sup>p1206</sup> [this's port 1](#)<sup>p1204</sup> and [this's port 2](#)<sup>p1204</sup>.

The **port1** getter steps are to return [this's port 1](#)<sup>p1204</sup>.

The **port2** getter steps are to return [this's port 2](#)<sup>p1204</sup>.

#### 9.4.3 The [MessageEventTarget](#)<sup>p1205</sup> mixin <sup>§ p1205</sup>

```
IDL interface mixin MessageEventTarget {
  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};
```

The following are the [event handlers](#)<sup>p1136</sup> (and their corresponding [event handler event types](#)<sup>p1139</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p1137</sup>, by objects implementing the [MessageEventTarget](#)<sup>p1205</sup> interface:

<a href="#">Event handler</a> <sup>p1136</sup>	<a href="#">Event handler event type</a> <sup>p1139</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1471</sup>
<a href="#">onmessageerror</a>	<a href="#">messageerror</a> <sup>p1472</sup>

#### 9.4.4 Message ports <sup>§ p1205</sup>

Each channel has two message ports. Data sent through one port is received by the other port, and vice versa.

```
IDL [Exposed=(Window,Worker,AudioWorklet), Transferable]
interface MessagePort : EventTarget {
  undefined postMessage(any message, sequence<object> transfer);
  undefined postMessage(any message, optional StructuredSerializeOptions options = {});
  undefined start();
  undefined close();

  // event handlers
  attribute EventHandler onclose;
};

MessagePort includes MessageEventTarget;

dictionary StructuredSerializeOptions {
  sequence<object> transfer = [];
};
```

#### For web developers (non-normative)

**port.postMessage**<sup>p1208</sup>(*message* [, *transfer*])

**port.postMessage**<sup>p1208</sup>(*message* [, { *transfer* }])

Posts a message through the channel. Objects listed in *transfer* are transferred, not just cloned, meaning that they are no longer usable on the sending side.

Throws a ["DataCloneError" DOMException](#) if *transfer* contains duplicate objects or *port*, or if *message* could not be cloned.

**port.start**<sup>p1208</sup>()

Begins dispatching messages received on the port.

**port.close**<sup>p1208</sup>()

Disconnects the port, so that it is no longer active.

Each `MessagePort`<sup>p1205</sup> object has a **message event target** (a `MessageEventTarget`<sup>p1205</sup>), to which the `message`<sup>p1471</sup> and `messageerror`<sup>p1472</sup> events are dispatched. Unless otherwise specified, it defaults to the `MessagePort`<sup>p1205</sup> object itself.

Each `MessagePort`<sup>p1205</sup> object can be entangled with another (a symmetric relationship). Each `MessagePort`<sup>p1205</sup> object also has a `task source`<sup>p1124</sup> called the **port message queue**, initially empty. A `port message queue`<sup>p1206</sup> can be enabled or disabled, and is initially disabled. Once enabled, a port can never be disabled again (though messages in the queue can get moved to another queue or removed altogether, which has much the same effect). A `MessagePort`<sup>p1205</sup> also has a **has been shipped** flag, which must initially be false.

When a port's `port message queue`<sup>p1206</sup> is enabled, the `event loop`<sup>p1123</sup> must use it as one of its `task sources`<sup>p1124</sup>. When a port's `relevant global object`<sup>p1083</sup> is a `Window`<sup>p922</sup>, all `tasks`<sup>p1124</sup> `queued`<sup>p1125</sup> on its `port message queue`<sup>p1206</sup> must be associated with the port's `relevant global object`<sup>p1083</sup>'s `associated Document`<sup>p923</sup>.

#### Note

*If the document is `fully active`<sup>p1003</sup>, but the event listeners were all created in the context of documents that are not `fully active`<sup>p1003</sup>, then the messages will not be received unless and until the documents become `fully active`<sup>p1003</sup> again.*

Each `event loop`<sup>p1123</sup> has a `task source`<sup>p1124</sup> called the **unshipped port message queue**. This is a virtual `task source`<sup>p1124</sup>: it must act as if it contained the `tasks`<sup>p1124</sup> of each `port message queue`<sup>p1206</sup> of each `MessagePort`<sup>p1205</sup> whose `has been shipped`<sup>p1206</sup> flag is false, whose `port message queue`<sup>p1206</sup> is enabled, and whose `relevant agent`<sup>p1073</sup>'s `event loop`<sup>p1123</sup> is that `event loop`<sup>p1123</sup>, in the order in which they were added to their respective `task source`<sup>p1124</sup>. When a `task`<sup>p1124</sup> would be removed from the `unshipped port message queue`<sup>p1206</sup>, it must instead be removed from its `port message queue`<sup>p1206</sup>.

When a `MessagePort`<sup>p1205</sup>'s `has been shipped`<sup>p1206</sup> flag is false, its `port message queue`<sup>p1206</sup> must be ignored for the purposes of the `event loop`<sup>p1123</sup>. (The `unshipped port message queue`<sup>p1206</sup> is used instead.)

#### Note

*The `has been shipped`<sup>p1206</sup> flag is set to true when a port, its twin, or the object it was cloned from, is or has been transferred. When a `MessagePort`<sup>p1205</sup>'s `has been shipped`<sup>p1206</sup> flag is true, its `port message queue`<sup>p1206</sup> acts as a first-class `task source`<sup>p1124</sup>, unaffected to any `unshipped port message queue`<sup>p1206</sup>.*

When the user agent is to **entangle** two `MessagePort`<sup>p1205</sup> objects, it must run the following steps:

1. If one of the ports is already entangled, then disentangle it and the port that it was entangled with.

#### Note

*If those two previously entangled ports were the two ports of a `MessageChannel`<sup>p1204</sup> object, then that `MessageChannel`<sup>p1204</sup> object no longer represents an actual channel: the two ports in that object are no longer entangled.*

2. Associate the two ports to be entangled, so that they form the two parts of a new channel. (There is no `MessageChannel`<sup>p1204</sup> object that represents this channel.)

Two ports A and B that have gone through this step are now said to be entangled; one is entangled to the other, and vice versa.

#### Note

*While this specification describes this process as instantaneous, implementations are more likely to implement it via message passing. As with all algorithms, the key is "merely" that the end result be indistinguishable, in a black-box sense, from the specification.*

The **disentangle** steps, given a `MessagePort`<sup>p1205</sup> `initiatorPort` which initiates disentangling, are as follows:

1. Let `otherPort` be the `MessagePort`<sup>p1205</sup> which `initiatorPort` was entangled with.
2. **Assert**: `otherPort` exists.
3. Disentangle `initiatorPort` and `otherPort`, so that they are no longer entangled or associated with each other.
4. **Fire an event** named `close`<sup>p1471</sup> at `otherPort`.

#### Note

The `close`<sup>p1471</sup> event will be fired even if the port is not explicitly closed. The cases where this event is dispatched are:

- the `close()`<sup>p1208</sup> method was called;
- the `Document`<sup>p130</sup> was `destroyed`<sup>p1066</sup>; or
- the `MessagePort`<sup>p1205</sup> was `garbage collected`<sup>p1208</sup>.

We only dispatch the event on `otherPort` because `initiatorPort` explicitly triggered the close, its `Document`<sup>p130</sup> no longer exists, or it was already garbage collected, as described above.

`MessagePort`<sup>p1205</sup> objects are `transferable objects`<sup>p118</sup>. Their `transfer steps`<sup>p118</sup>, given `value` and `dataHolder`, are:

1. Set `value`'s `has been shipped`<sup>p1206</sup> flag to true.
2. Set `dataHolder`.`[[PortMessageQueue]]` to `value`'s `port message queue`<sup>p1206</sup>.
3. If `value` is entangled with another port `remotePort`, then:
  1. Set `remotePort`'s `has been shipped`<sup>p1206</sup> flag to true.
  2. Set `dataHolder`.`[[RemotePort]]` to `remotePort`.
4. Otherwise, set `dataHolder`.`[[RemotePort]]` to null.

Their `transfer-receiving steps`<sup>p118</sup>, given `dataHolder` and `value`, are:

1. Set `value`'s `has been shipped`<sup>p1206</sup> flag to true.
2. Move all the `tasks`<sup>p1124</sup> that are to fire `message`<sup>p1471</sup> events in `dataHolder`.`[[PortMessageQueue]]` to the `port message queue`<sup>p1206</sup> of `value`, if any, leaving `value`'s `port message queue`<sup>p1206</sup> in its initial disabled state, and, if `value`'s `relevant global object`<sup>p1083</sup> is a `Window`<sup>p922</sup>, associating the moved `tasks`<sup>p1124</sup> with `value`'s `relevant global object`<sup>p1083</sup>'s `associated Document`<sup>p923</sup>.
3. If `dataHolder`.`[[RemotePort]]` is not null, then `entangle`<sup>p1206</sup> `dataHolder`.`[[RemotePort]]` and `value`. (This will disentangle `dataHolder`.`[[RemotePort]]` from the original port that was transferred.)

The **message port post message steps**, given `sourcePort`, `targetPort`, `message` and `options` are as follows:

1. Let `transfer` be `options`["`transfer`"<sup>p1205</sup>].
2. If `transfer` `contains` `sourcePort`, then throw a "`DataCloneError`" `DOMException`.
3. Let `doomed` be false.
4. If `targetPort` is not null and `transfer` `contains` `targetPort`, then set `doomed` to true and optionally report to a developer console that the target port was posted to itself, causing the communication channel to be lost.
5. Let `serializeWithTransferResult` be `StructuredSerializeWithTransfer`<sup>p125</sup>(`message`, `transfer`). Rethrow any exceptions.
6. If `targetPort` is null, or if `doomed` is true, then return.
7. Add a `task`<sup>p1124</sup> that runs the following steps to the `port message queue`<sup>p1206</sup> of `targetPort`:
  1. Let `finalTargetPort` be the `MessagePort`<sup>p1205</sup> in whose `port message queue`<sup>p1206</sup> the task now finds itself.

#### Note

This can be different from `targetPort`, if `targetPort` itself was transferred and thus all its tasks moved along with it.

2. Let `messageEventTarget` be `finalTargetPort`'s `message event target`<sup>p1206</sup>.
3. Let `targetRealm` be `finalTargetPort`'s `relevant realm`<sup>p1083</sup>.
4. Let `deserializeRecord` be `StructuredDeserializeWithTransfer`<sup>p127</sup>(`serializeWithTransferResult`, `targetRealm`).

If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1472</sup> at [messageEventTarget](#), using [MessageEvent](#)<sup>p1189</sup>, and then return.

5. Let *messageClone* be [deserializeRecord](#).[[Deserialized]].
6. Let *newPorts* be a new [frozen array](#) consisting of all [MessagePort](#)<sup>p1205</sup> objects in [deserializeRecord](#).[[TransferredValues]], if any, maintaining their relative order.
7. [Fire an event](#) named [message](#)<sup>p1471</sup> at [messageEventTarget](#), using [MessageEvent](#)<sup>p1189</sup>, with the [data](#)<sup>p1189</sup> attribute initialized to *messageClone* and the [ports](#)<sup>p1190</sup> attribute initialized to *newPorts*.

The [postMessage\(message, options\)](#) method steps are:

1. Let *targetPort* be the port with which [this](#) is entangled, if any; otherwise let it be null.
2. Run the [message port post message steps](#)<sup>p1207</sup> providing [this](#), *targetPort*, *message* and *options*.

The [postMessage\(message, transfer\)](#) method steps are:

1. Let *targetPort* be the port with which [this](#) is entangled, if any; otherwise let it be null.
2. Let *options* be «[ "[transfer](#)<sup>p1205</sup>" → *transfer* ]».
3. Run the [message port post message steps](#)<sup>p1207</sup> providing [this](#), *targetPort*, *message* and *options*.

The [start\(\)](#) method steps are to enable [this](#)'s [port message queue](#)<sup>p1206</sup>, if it is not already enabled.

The [close\(\)](#) method steps are:

1. Set [this](#)'s [\[\[Detached\]\]](#)<sup>p118</sup> internal slot value to true.
2. If [this](#) is entangled, [disentangle](#)<sup>p1206</sup> it.

The following are the [event handlers](#)<sup>p1136</sup> (and their corresponding [event handler event types](#)<sup>p1139</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p1137</sup>, by all objects implementing the [MessagePort](#)<sup>p1205</sup> interface:

<a href="#">Event handler</a> <sup>p1136</sup>	<a href="#">Event handler event type</a> <sup>p1139</sup>
<a href="#">onclose</a>	<a href="#">close</a> <sup>p1471</sup>

The first time a [MessagePort](#)<sup>p1205</sup> object's [onmessage](#)<sup>p1205</sup> IDL attribute is set, the port's [port message queue](#)<sup>p1206</sup> must be enabled, as if the [start\(\)](#)<sup>p1208</sup> method had been called.

### 9.4.5 Ports and garbage collection <sup>p1208</sup>

When a [MessagePort](#)<sup>p1205</sup> object *o* is garbage collected, if *o* is entangled, then the user agent must [disentangle](#)<sup>p1206</sup> *o*.

When a [MessagePort](#)<sup>p1205</sup> object *o* is entangled and [message](#)<sup>p1471</sup> or [messageerror](#)<sup>p1472</sup> event listener is registered, user agents must act as if *o*'s entangled [MessagePort](#)<sup>p1205</sup> object has a strong reference to *o*.

Furthermore, a [MessagePort](#)<sup>p1205</sup> object must not be garbage collected while there exists an event referenced by a [task](#)<sup>p1124</sup> in a [task queue](#)<sup>p1123</sup> that is to be dispatched on that [MessagePort](#)<sup>p1205</sup> object, or while the [MessagePort](#)<sup>p1205</sup> object's [port message queue](#)<sup>p1206</sup> is enabled and not empty.

#### Note

*Thus, a message port can be received, given an event listener, and then forgotten, and so long as that event listener could receive a message, the channel will be maintained.*

*Of course, if this was to occur on both sides of the channel, then both ports could be garbage collected, since they would not be reachable from live code, despite having a strong reference to each other. However, if a message port has a pending message, it is*

not garbage collected.

#### Note

Authors are strongly encouraged to explicitly close [MessagePort](#)<sup>p1205</sup> objects to disentangle them, so that their resources can be reclaimed. Creating many [MessagePort](#)<sup>p1205</sup> objects and discarding them without closing them can lead to high transient memory usage since garbage collection is not necessarily performed promptly, especially for [MessagePort](#)<sup>p1205</sup>s where garbage collection can involve cross-process coordination.

## 9.5 Broadcasting to other browsing contexts <sup>§ p1209</sup>

Pages on a single [origin](#)<sup>p898</sup> opened by the same user in the same user agent but in different unrelated [browsing contexts](#)<sup>p998</sup> sometimes need to send notifications to each other, for example "hey, the user logged in over here, check your credentials again".

For elaborate cases, e.g. to manage locking of shared state, to manage synchronization of resources between a server and multiple local clients, to share a [WebSocket](#) connection with a remote host, and so forth, [shared workers](#)<sup>p1237</sup> are the most appropriate solution.

For simple cases, though, where a shared worker would be an unreasonable overhead, authors can use the simple channel-based broadcast mechanism described in this section.

IDL

```
[Exposed=(Window,Worker)]
interface BroadcastChannel : EventTarget {
  constructor(DOMString name);

  readonly attribute DOMString name;
  undefined postMessage(any message);
  undefined close();
  attribute EventHandler onmessage;
  attribute EventHandler onmessageerror;
};
```

For web developers (non-normative)

**`broadcastChannel = new BroadcastChannel`**<sup>p1209</sup>(*name*)

Returns a new [BroadcastChannel](#)<sup>p1209</sup> object via which messages for the given channel name can be sent and received.

**`broadcastChannel.name`**<sup>p1209</sup>

Returns the channel name (as passed to the constructor).

**`broadcastChannel.postMessage`**<sup>p1210</sup>(*message*)

Sends the given message to other [BroadcastChannel](#)<sup>p1209</sup> objects set up for this channel. Messages can be structured objects, e.g. nested objects and arrays.

**`broadcastChannel.close`**<sup>p1210</sup>()

Closes the [BroadcastChannel](#)<sup>p1209</sup> object, opening it up to garbage collection.

A [BroadcastChannel](#)<sup>p1209</sup> object has a **channel name** and a **closed flag**.

The **`new BroadcastChannel(name)`** constructor steps are:

1. Set **this**'s [channel name](#)<sup>p1209</sup> to *name*.
2. Set **this**'s [closed flag](#)<sup>p1209</sup> to false.

The **`name`** getter steps are to return **this**'s [channel name](#)<sup>p1209</sup>.

A [BroadcastChannel](#)<sup>p1209</sup> object is said to be **eligible for messaging** when its [relevant global object](#)<sup>p1083</sup> is either:

- a [Window](#)<sup>p922</sup> object whose [associated Document](#)<sup>p923</sup> is [fully active](#)<sup>p1003</sup>, or

- a [WorkerGlobalScope](#)<sup>p1228</sup> object whose [closing](#)<sup>p1231</sup> flag is false and whose [worker](#)<sup>p1236</sup> is not a [suspendable worker](#)<sup>p1232</sup>.

The [postMessage\(message\)](#) method steps are:

1. If [this](#) is not [eligible for messaging](#)<sup>p1209</sup>, then return.
2. If [this](#)'s [closed flag](#)<sup>p1209</sup> is true, then throw an ["InvalidStateError" DOMException](#).
3. Let *serialized* be [StructuredSerialize](#)<sup>p122</sup>(*message*). Rethrow any exceptions.
4. Let *sourceOrigin* be [this](#)'s [relevant settings object](#)<sup>p1083</sup>'s [origin](#)<sup>p1076</sup>.
5. Let *sourceStorageKey* be the result of running [obtain a storage key for non-storage purposes](#) with [this](#)'s [relevant settings object](#)<sup>p1083</sup>.
6. Let *destinations* be a list of [BroadcastChannel](#)<sup>p1209</sup> objects that match the following criteria:
  - They are [eligible for messaging](#)<sup>p1209</sup>.
  - The result of running [obtain a storage key for non-storage purposes](#) with their [relevant settings object](#)<sup>p1083</sup> equals *sourceStorageKey*.
  - Their [channel name](#)<sup>p1209</sup> is [this](#)'s [channel name](#)<sup>p1209</sup>.
7. Remove *source* from *destinations*.
8. Sort *destinations* such that all [BroadcastChannel](#)<sup>p1209</sup> objects whose [relevant agents](#)<sup>p1073</sup> are the same are sorted in creation order, oldest first. (This does not define a complete ordering. Within this constraint, user agents may sort the list in any [implementation-defined](#) manner.)
9. For each *destination* in *destinations*, [queue a global task](#)<sup>p1125</sup> on the [DOM manipulation task source](#)<sup>p1134</sup> given *destination*'s [relevant global object](#)<sup>p1083</sup> to perform the following steps:
  1. If *destination*'s [closed flag](#)<sup>p1209</sup> is true, then abort these steps.
  2. Let *targetRealm* be *destination*'s [relevant realm](#)<sup>p1083</sup>.
  3. Let *data* be [StructuredDeserialize](#)<sup>p122</sup>(*serialized*, *targetRealm*).  
If this throws an exception, catch it, [fire an event](#) named [messageerror](#)<sup>p1472</sup> at *destination*, using [MessageEvent](#)<sup>p1189</sup>, with the [origin](#)<sup>p1190</sup> attribute initialized to the [serialization](#)<sup>p898</sup> of *sourceOrigin*, and then abort these steps.
  4. [Fire an event](#) named [message](#)<sup>p1471</sup> at *destination*, using [MessageEvent](#)<sup>p1189</sup>, with the [data](#)<sup>p1189</sup> attribute initialized to *data* and the [origin](#)<sup>p1190</sup> attribute initialized to the [serialization](#)<sup>p898</sup> of *sourceOrigin*.

While a [BroadcastChannel](#)<sup>p1209</sup> object whose [closed flag](#)<sup>p1209</sup> is false has an event listener registered for [message](#)<sup>p1471</sup> or [messageerror](#)<sup>p1472</sup> events, there must be a strong reference from the [BroadcastChannel](#)<sup>p1209</sup> object's [relevant global object](#)<sup>p1083</sup> to the [BroadcastChannel](#)<sup>p1209</sup> object itself.

The [close\(\)](#) method steps are to set [this](#)'s [closed flag](#)<sup>p1209</sup> to true.

#### Note

*Authors are strongly encouraged to explicitly close [BroadcastChannel](#)<sup>p1209</sup> objects when they are no longer needed, so that they can be garbage collected. Creating many [BroadcastChannel](#)<sup>p1209</sup> objects and discarding them while leaving them with an event listener and without closing them can lead to an apparent memory leak, since the objects will continue to live for as long as they have an event listener (or until their page or worker is closed).*

The following are the [event handlers](#)<sup>p1136</sup> (and their corresponding [event handler event types](#)<sup>p1139</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p1137</sup>, by all objects implementing the [BroadcastChannel](#)<sup>p1209</sup> interface:

Event handler <sup>p1136</sup>	Event handler event type <sup>p1139</sup>
<a href="#">onmessage</a>	<a href="#">message</a> <sup>p1471</sup>
<a href="#">onmessageerror</a>	<a href="#">messageerror</a> <sup>p1472</sup>

### Example

Suppose a page wants to know when the user logs out, even when the user does so from another tab at the same site:

```
var authChannel = new BroadcastChannel('auth');
authChannel.onmessage = function (event) {
  if (event.data == 'logout')
    showLogout();
}

function logoutRequested() {
  // called when the user asks us to log them out
  doLogout();
  showLogout();
  authChannel.postMessage('logout');
}

function doLogout() {
  // actually log the user out (e.g. clearing cookies)
  // ...
}

function showLogout() {
  // update the UI to indicate we're logged out
  // ...
}
```

## 10 Web workers §<sup>p12</sup><sub>12</sub>

### 10.1 Introduction §<sup>p12</sup><sub>12</sub>

#### 10.1.1 Scope §<sup>p12</sup><sub>12</sub>

*This section is non-normative.*

This specification defines an API for running scripts in the background independently of any user interface scripts.

This allows for long-running scripts that are not interrupted by scripts that respond to clicks or other user interactions, and allows long tasks to be executed without yielding to keep the page responsive.

Workers (as these background scripts are called herein) are relatively heavy-weight, and are not intended to be used in large numbers. For example, it would be inappropriate to launch one worker for each pixel of a four megapixel image. The examples below show some appropriate uses of workers.

Generally, workers are expected to be long-lived, have a high start-up performance cost, and a high per-instance memory cost.

#### 10.1.2 Examples §<sup>p12</sup><sub>12</sub>

*This section is non-normative.*

There are a variety of uses that workers can be put to. The following subsections show various examples of this use.

##### 10.1.2.1 A background number-crunching worker §<sup>p12</sup><sub>12</sub>

*This section is non-normative.*

The simplest use of workers is for performing a computationally expensive task without interrupting the user interface.

In this example, the main document spawns a worker to (naïvely) compute prime numbers, and progressively displays the most recently found prime number.

The main page is as follows:

```
<!DOCTYPE HTML>
<html lang="en">
  <head>
    <meta charset="utf-8">
    <title>Worker example: One-core computation</title>
  </head>
  <body>
    <p>The highest prime number discovered so far is: <output id="result"></output></p>
    <script>
      var worker = new Worker('worker.js');
      worker.onmessage = function (event) {
        document.getElementById('result').textContent = event.data;
      };
    </script>
  </body>
</html>
```

The [Worker\(\)](#) p1236 constructor call creates a worker and returns a [Worker](#) p1236 object representing that worker, which is used to

communicate with the worker. That object's [onmessage](#)<sup>p1205</sup> event handler allows the code to receive messages from the worker.

The worker itself is as follows:

```
var n = 1;
search: while (true) {
  n += 1;
  for (var i = 2; i <= Math.sqrt(n); i += 1)
    if (n % i == 0)
      continue search;
  // found a prime!
  postMessage(n);
}
```

The bulk of this code is simply an unoptimized search for a prime number. The [postMessage\(\)](#)<sup>p1230</sup> method is used to send a message back to the page when a prime is found.

[View this example online.](#)

#### 10.1.2.2 Using a JavaScript module as a worker <sup>p12</sup><sub>13</sub>

*This section is non-normative.*

All of our examples so far show workers that run [classic scripts](#)<sup>p1085</sup>. Workers can instead be instantiated using [module scripts](#)<sup>p1085</sup>, which have the usual benefits: the ability to use the JavaScript `import` statement to import other modules; strict mode by default; and top-level declarations not polluting the worker's global scope.

As the `import` statement is available, the [importScripts\(\)](#)<sup>p1239</sup> method will automatically fail inside module workers.

In this example, the main document uses a worker to do off-main-thread image manipulation. It imports the filters used from another module.

The main page is as follows:

```
<!DOCTYPE html>
<html lang="en">
<meta charset="utf-8">
<title>Worker example: image decoding</title>

<p>
  <label>
    Type an image URL to decode
    <input type="url" id="image-url" list="image-list">
    <datalist id="image-list">
      <option value="https://html.spec.whatwg.org/images/drawImage.png">
      <option value="https://html.spec.whatwg.org/images/robots.jpeg">
      <option value="https://html.spec.whatwg.org/images/arcTo2.png">
    </datalist>
  </label>
</p>

<p>
  <label>
    Choose a filter to apply
    <select id="filter">
      <option value="none">none</option>
      <option value="grayscale">grayscale</option>
      <option value="brighten">brighten by 20%</option>
    </select>
  </label>
</p>
```

```

<div id="output"></div>

<script type="module">
  const worker = new Worker("worker.js", { type: "module" });
  worker.onmessage = receiveFromWorker;

  const url = document.querySelector("#image-url");
  const filter = document.querySelector("#filter");
  const output = document.querySelector("#output");

  url.oninput = updateImage;
  filter.oninput = sendToWorker;

  let imageData, context;

  function updateImage() {
    const img = new Image();
    img.src = url.value;

    img.onload = () => {
      const canvas = document.createElement("canvas");
      canvas.width = img.width;
      canvas.height = img.height;

      context = canvas.getContext("2d");
      context.drawImage(img, 0, 0);
      imageData = context.getImageData(0, 0, canvas.width, canvas.height);

      sendToWorker();
      output.replaceChildren(canvas);
    };
  }

  function sendToWorker() {
    worker.postMessage({ imageData, filter: filter.value });
  }

  function receiveFromWorker(e) {
    context.putImageData(e.data, 0, 0);
  }
</script>

```

The worker file is then:

```

import * as filters from "./filters.js";

self.onmessage = e => {
  const { imageData, filter } = e.data;
  filters[filter](imageData);
  self.postMessage(imageData, [imageData.data.buffer]);
};

```

Which imports the file filters.js:

```

export function none() {}

export function grayscale({ data: d }) {
  for (let i = 0; i < d.length; i += 4) {
    const [r, g, b] = [d[i], d[i + 1], d[i + 2]];

```

```

    // CIE luminance for the RGB
    // The human eye is bad at seeing red and blue, so we de-emphasize them.
    d[i] = d[i + 1] = d[i + 2] = 0.2126 * r + 0.7152 * g + 0.0722 * b;
  }
};

export function brighten({ data: d }) {
  for (let i = 0; i < d.length; ++i) {
    d[i] *= 1.2;
  }
};

```

[View this example online.](#)

### 10.1.2.3 Shared workers introduction <sup>§<sup>p12</sup></sup><sub>15</sub>

*This section is non-normative.*

This section introduces shared workers using a Hello World example. Shared workers use slightly different APIs, since each worker can have multiple connections.

This first example shows how you connect to a worker and how a worker can send a message back to the page when it connects to it. Received messages are displayed in a log.

Here is the HTML page:

```

<!DOCTYPE HTML>
<html lang="en">
<meta charset="utf-8">
<title>Shared workers: demo 1</title>
<pre id="log">Log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.onmessage = function(e) { // note: not worker.onmessage!
    log.textContent += '\n' + e.data;
  }
</script>

```

Here is the JavaScript worker:

```

onconnect = function(e) {
  var port = e.ports[0];
  port.postMessage('Hello World!');
}

```

[View this example online.](#)

This second example extends the first one by changing two things: first, messages are received using `addEventListener()` instead of an [event handler IDL attribute](#)<sup>p137</sup>, and second, a message is sent to the worker, causing the worker to send another message in return. Received messages are again displayed in a log.

Here is the HTML page:

```

<!DOCTYPE HTML>
<html lang="en">
<meta charset="utf-8">
<title>Shared workers: demo 2</title>
<pre id="log">Log:</pre>

```

```

<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.addEventListener('message', function(e) {
    log.textContent += '\n' + e.data;
  }, false);
  worker.port.start(); // note: need this when using addEventListener
  worker.port.postMessage('ping');
</script>

```

Here is the JavaScript worker:

```

onconnect = function(e) {
  var port = e.ports[0];
  port.postMessage('Hello World!');
  port.onmessage = function(e) {
    port.postMessage('pong'); // not e.ports[0].postMessage!
    // e.target.postMessage('pong'); would work also
  }
}

```

[View this example online.](#)

Finally, the example is extended to show how two pages can connect to the same worker; in this case, the second page is merely in an [iframe](#)<sup>p390</sup> on the first page, but the same principle would apply to an entirely separate page in a separate [top-level traversable](#)<sup>p990</sup>.

Here is the outer HTML page:

```

<!DOCTYPE HTML>
<html lang="en">
<meta charset="utf-8">
<title>Shared workers: demo 3</title>
<pre id="log">Log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.addEventListener('message', function(e) {
    log.textContent += '\n' + e.data;
  }, false);
  worker.port.start();
  worker.port.postMessage('ping');
</script>
<iframe src="inner.html"></iframe>

```

Here is the inner HTML page:

```

<!DOCTYPE HTML>
<html lang="en">
<meta charset="utf-8">
<title>Shared workers: demo 3 inner frame</title>
<pre id=log>Inner log:</pre>
<script>
  var worker = new SharedWorker('test.js');
  var log = document.getElementById('log');
  worker.port.onmessage = function(e) {
    log.textContent += '\n' + e.data;
  }
</script>

```

Here is the JavaScript worker:

```

var count = 0;
onconnect = function(e) {
  count += 1;
  var port = e.ports[0];
  port.postMessage('Hello World! You are connection #' + count);
  port.onmessage = function(e) {
    port.postMessage('pong');
  }
}
}

```

[View this example online.](#)

#### 10.1.2.4 Shared state using a shared worker <sup>§p12</sup><sub>17</sub>

*This section is non-normative.*

In this example, multiple windows (viewers) can be opened that are all viewing the same map. All the windows share the same map information, with a single worker coordinating all the viewers. Each viewer can move around independently, but if they set any data on the map, all the viewers are updated.

The main page isn't interesting, it merely provides a way to open the viewers:

```

<!DOCTYPE HTML>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Workers example: Multiviewer</title>
  <script>
    function openViewer() {
      window.open('viewer.html');
    }
  </script>
</head>
<body>
  <p><button type="button" onclick="openViewer()">Open a new
  viewer</button></p>
  <p>Each viewer opens in a new window. You can have as many viewers
  as you like, they all view the same data.</p>
</body>
</html>

```

The viewer is more involved:

```

<!DOCTYPE HTML>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Workers example: Multiviewer viewer</title>
  <script>
    var worker = new SharedWorker('worker.js', 'core');

    // CONFIGURATION
    function configure(event) {
      if (event.data.substr(0, 4) != 'cfg ') return;
      var name = event.data.substr(4).split(' ', 1)[0];
      // update display to mention our name is name
      document.getElementsByTagName('h1')[0].textContent += ' ' + name;
      // no longer need this listener
      worker.port.removeEventListener('message', configure, false);
    }
  </script>

```

```

worker.port.addEventListener('message', configure, false);

// MAP
function paintMap(event) {
  if (event.data.substr(0, 4) !== 'map ') return;
  var data = event.data.substr(4).split(',');
  // display tiles data[0] .. data[8]
  var canvas = document.getElementById('map');
  var context = canvas.getContext('2d');
  for (var y = 0; y < 3; y += 1) {
    for (var x = 0; x < 3; x += 1) {
      var tile = data[y * 3 + x];
      if (tile === '0')
        context.fillStyle = 'green';
      else
        context.fillStyle = 'maroon';
      context.fillRect(x * 50, y * 50, 50, 50);
    }
  }
}
worker.port.addEventListener('message', paintMap, false);

// PUBLIC CHAT
function updatePublicChat(event) {
  if (event.data.substr(0, 4) !== 'txt ') return;
  var name = event.data.substr(4).split(' ', 1)[0];
  var message = event.data.substr(4 + name.length + 1);
  // display "<name> message" in public chat
  var public = document.getElementById('public');
  var p = document.createElement('p');
  var n = document.createElement('button');
  n.textContent = '<' + name + '> ';
  n.onclick = function () { worker.port.postMessage('msg ' + name); };
  p.appendChild(n);
  var m = document.createElement('span');
  m.textContent = message;
  p.appendChild(m);
  public.appendChild(p);
}
worker.port.addEventListener('message', updatePublicChat, false);

// PRIVATE CHAT
function startPrivateChat(event) {
  if (event.data.substr(0, 4) !== 'msg ') return;
  var name = event.data.substr(4).split(' ', 1)[0];
  var port = event.ports[0];
  // display a private chat UI
  var ul = document.getElementById('private');
  var li = document.createElement('li');
  var h3 = document.createElement('h3');
  h3.textContent = 'Private chat with ' + name;
  li.appendChild(h3);
  var div = document.createElement('div');
  var addMessage = function(name, message) {
    var p = document.createElement('p');
    var n = document.createElement('strong');
    n.textContent = '<' + name + '> ';
    p.appendChild(n);
    var t = document.createElement('span');
    t.textContent = message;
    p.appendChild(t);
    div.appendChild(p);
  };
}

```

```

};
port.onmessage = function (event) {
  addMessage(name, event.data);
};
li.appendChild(div);
var form = document.createElement('form');
var p = document.createElement('p');
var input = document.createElement('input');
input.size = 50;
p.appendChild(input);
p.appendChild(document.createTextNode(' '));
var button = document.createElement('button');
button.textContent = 'Post';
p.appendChild(button);
form.onsubmit = function () {
  port.postMessage(input.value);
  addMessage('me', input.value);
  input.value = '';
  return false;
};
form.appendChild(p);
li.appendChild(form);
ul.appendChild(li);
}
worker.port.addEventListener('message', startPrivateChat, false);

worker.port.start();
</script>
</head>
<body>
<h1>Viewer</h1>
<h2>Map</h2>
<p><canvas id="map" height=150 width=150></canvas></p>
<p>
  <button type=button onclick="worker.port.postMessage('mov left')">Left</button>
  <button type=button onclick="worker.port.postMessage('mov up')">Up</button>
  <button type=button onclick="worker.port.postMessage('mov down')">Down</button>
  <button type=button onclick="worker.port.postMessage('mov right')">Right</button>
  <button type=button onclick="worker.port.postMessage('set 0')">Set 0</button>
  <button type=button onclick="worker.port.postMessage('set 1')">Set 1</button>
</p>
<h2>Public Chat</h2>
<div id="public"></div>
<form onsubmit="worker.port.postMessage('txt ' + message.value); message.value = ''; return false;">
  <p>
    <input type="text" name="message" size="50">
    <button>Post</button>
  </p>
</form>
<h2>Private Chat</h2>
<ul id="private"></ul>
</body>
</html>

```

There are several key things worth noting about the way the viewer is written.

**Multiple listeners.** Instead of a single message processing function, the code here attaches multiple event listeners, each one performing a quick check to see if it is relevant for the message. In this example it doesn't make much difference, but if multiple authors wanted to collaborate using a single port to communicate with a worker, it would allow for independent code instead of changes having to all be made to a single event handling function.

Registering event listeners in this way also allows you to unregister specific listeners when you are done with them, as is done with the `configure()` method in this example.

Finally, the worker:

```
var nextName = 0;
function getNextName() {
  // this could use more friendly names
  // but for now just return a number
  return nextName++;
}

var map = [
  [0, 0, 0, 0, 0, 0, 0],
  [1, 1, 0, 1, 0, 1, 1],
  [0, 1, 0, 1, 0, 0, 0],
  [0, 1, 0, 1, 0, 1, 1],
  [0, 0, 0, 1, 0, 0, 0],
  [1, 0, 0, 1, 1, 1, 1],
  [1, 1, 0, 1, 1, 0, 1],
];

function wrapX(x) {
  if (x < 0) return wrapX(x + map[0].length);
  if (x >= map[0].length) return wrapX(x - map[0].length);
  return x;
}

function wrapY(y) {
  if (y < 0) return wrapY(y + map.length);
  if (y >= map[0].length) return wrapY(y - map.length);
  return y;
}

function wrap(val, min, max) {
  if (val < min)
    return val + (max-min)+1;
  if (val > max)
    return val - (max-min)-1;
  return val;
}

function sendMapData(viewer) {
  var data = '';
  for (var y = viewer.y-1; y <= viewer.y+1; y += 1) {
    for (var x = viewer.x-1; x <= viewer.x+1; x += 1) {
      if (data != '')
        data += ',';
      data += map[wrap(y, 0, map[0].length-1)][wrap(x, 0, map.length-1)];
    }
  }
  viewer.port.postMessage('map ' + data);
}

var viewers = {};
onconnect = function (event) {
  var name = getNextName();
  event.ports[0]._data = { port: event.ports[0], name: name, x: 0, y: 0, };
  viewers[name] = event.ports[0]._data;
  event.ports[0].postMessage('cfg ' + name);
  event.ports[0].onmessage = getMessage;
  sendMapData(event.ports[0]._data);
};

function getMessage(event) {
```

```

switch (event.data.substr(0, 4)) {
  case 'mov ':
    var direction = event.data.substr(4);
    var dx = 0;
    var dy = 0;
    switch (direction) {
      case 'up': dy = -1; break;
      case 'down': dy = 1; break;
      case 'left': dx = -1; break;
      case 'right': dx = 1; break;
    }
    event.target._data.x = wrapX(event.target._data.x + dx);
    event.target._data.y = wrapY(event.target._data.y + dy);
    sendMapData(event.target._data);
    break;
  case 'set ':
    var value = event.data.substr(4);
    map[event.target._data.y][event.target._data.x] = value;
    for (var viewer in viewers)
      sendMapData(viewers[viewer]);
    break;
  case 'txt ':
    var name = event.target._data.name;
    var message = event.data.substr(4);
    for (var viewer in viewers)
      viewers[viewer].port.postMessage('txt ' + name + ' ' + message);
    break;
  case 'msg ':
    var party1 = event.target._data;
    var party2 = viewers[event.data.substr(4).split(' ', 1)[0]];
    if (party2) {
      var channel = new MessageChannel();
      party1.port.postMessage('msg ' + party2.name, [channel.port1]);
      party2.port.postMessage('msg ' + party1.name, [channel.port2]);
    }
    break;
}
}
}

```

**Connecting to multiple pages.** The script uses the `onconnect`<sup>p1231</sup> event listener to listen for multiple connections.

**Direct channels.** When the worker receives a "msg" message from one viewer naming another viewer, it sets up a direct connection between the two, so that the two viewers can communicate directly without the worker having to proxy all the messages.

[View this example online.](#)

#### 10.1.2.5 Delegation <sup>§p12</sup><sub>21</sub>

*This section is non-normative.*

With multicore CPUs becoming prevalent, one way to obtain better performance is to split computationally expensive tasks amongst multiple workers. In this example, a computationally expensive task that is to be performed for every number from 1 to 10,000,000 is farmed out to ten subworkers.

The main page is as follows, it just reports the result:

```

<!DOCTYPE HTML>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Worker example: Multicore computation</title>

```

```

</head>
<body>
<p>Result: <output id="result"></output></p>
<script>
  var worker = new Worker('worker.js');
  worker.onmessage = function (event) {
    document.getElementById('result').textContent = event.data;
  };
</script>
</body>
</html>

```

The worker itself is as follows:

```

// settings
var num_workers = 10;
var items_per_worker = 1000000;

// start the workers
var result = 0;
var pending_workers = num_workers;
for (var i = 0; i < num_workers; i += 1) {
  var worker = new Worker('core.js');
  worker.postMessage(i * items_per_worker);
  worker.postMessage((i+1) * items_per_worker);
  worker.onmessage = storeResult;
}

// handle the results
function storeResult(event) {
  result += 1*event.data;
  pending_workers -= 1;
  if (pending_workers <= 0)
    postMessage(result); // finished!
}

```

It consists of a loop to start the subworkers, and then a handler that waits for all the subworkers to respond.

The subworkers are implemented as follows:

```

var start;
onmessage = getStart;
function getStart(event) {
  start = 1*event.data;
  onmessage = getEnd;
}

var end;
function getEnd(event) {
  end = 1*event.data;
  onmessage = null;
  work();
}

function work() {
  var result = 0;
  for (var i = start; i < end; i += 1) {
    // perform some complex calculation here
    result += 1;
  }
  postMessage(result);
  close();
}

```

```
}
```

They receive two numbers in two events, perform the computation for the range of numbers thus specified, and then report the result back to the parent.

[View this example online.](#)

#### 10.1.2.6 Providing libraries <sup>§p12</sup><sub>23</sub>

*This section is non-normative.*

Suppose that a cryptography library is made available that provides three tasks:

##### **Generate a public/private key pair**

Takes a port, on which it will send two messages, first the public key and then the private key.

##### **Given a plaintext and a public key, return the corresponding ciphertext**

Takes a port, to which any number of messages can be sent, the first giving the public key, and the remainder giving the plaintext, each of which is encrypted and then sent on that same channel as the ciphertext. The user can close the port when it is done encrypting content.

##### **Given a ciphertext and a private key, return the corresponding plaintext**

Takes a port, to which any number of messages can be sent, the first giving the private key, and the remainder giving the ciphertext, each of which is decrypted and then sent on that same channel as the plaintext. The user can close the port when it is done decrypting content.

The library itself is as follows:

```
function handleMessage(e) {
  if (e.data == "genkeys")
    genkeys(e.ports[0]);
  else if (e.data == "encrypt")
    encrypt(e.ports[0]);
  else if (e.data == "decrypt")
    decrypt(e.ports[0]);
}

function genkeys(p) {
  var keys = _generateKeyPair();
  p.postMessage(keys[0]);
  p.postMessage(keys[1]);
}

function encrypt(p) {
  var key, state = 0;
  p.onmessage = function (e) {
    if (state == 0) {
      key = e.data;
      state = 1;
    } else {
      p.postMessage(_encrypt(key, e.data));
    }
  };
}

function decrypt(p) {
  var key, state = 0;
  p.onmessage = function (e) {
    if (state == 0) {
      key = e.data;
      state = 1;
    }
  };
}
```

```

    } else {
      p.postMessage(_decrypt(key, e.data));
    }
  };
}

// support being used as a shared worker as well as a dedicated worker
if ('onmessage' in this) // dedicated worker
  onmessage = handleMessage;
else // shared worker
  onconnect = function (e) { e.port.onmessage = handleMessage; }

// the "crypto" functions:

function _generateKeyPair() {
  return [Math.random(), Math.random()];
}

function _encrypt(k, s) {
  return 'encrypted-' + k + ' ' + s;
}

function _decrypt(k, s) {
  return s.substr(s.indexOf(' ')+1);
}

```

Note that the crypto functions here are just stubs and don't do real cryptography.

This library could be used as follows:

```

<!DOCTYPE HTML>
<html lang="en">
<head>
  <meta charset="utf-8">
  <title>Worker example: Crypto library</title>
<script>
  const cryptoLib = new Worker('libcrypto-v1.js'); // or could use 'libcrypto-v2.js'
  function startConversation(source, message) {
    const messageChannel = new MessageChannel();
    source.postMessage(message, [messageChannel.port2]);
    return messageChannel.port1;
  }
  function getKeys() {
    let state = 0;
    startConversation(cryptoLib, "genkeys").onmessage = function (e) {
      if (state === 0)
        document.getElementById('public').value = e.data;
      else if (state === 1)
        document.getElementById('private').value = e.data;
      state += 1;
    };
  }
  function enc() {
    const port = startConversation(cryptoLib, "encrypt");
    port.postMessage(document.getElementById('public').value);
    port.postMessage(document.getElementById('input').value);
    port.onmessage = function (e) {
      document.getElementById('input').value = e.data;
      port.close();
    };
  }
}

```

```

function dec() {
  const port = startConversation(cryptoLib, "decrypt");
  port.postMessage(document.getElementById('private').value);
  port.postMessage(document.getElementById('input').value);
  port.onmessage = function (e) {
    document.getElementById('input').value = e.data;
    port.close();
  };
}
</script>
<style>
  textarea { display: block; }
</style>
</head>
<body onload="getKeys()">
  <fieldset>
    <legend>Keys</legend>
    <p><label>Public Key: <textarea id="public"></textarea></label></p>
    <p><label>Private Key: <textarea id="private"></textarea></label></p>
  </fieldset>
  <p><label>Input: <textarea id="input"></textarea></label></p>
  <p><button onclick="enc()">Encrypt</button> <button onclick="dec()">Decrypt</button></p>
</body>
</html>

```

A later version of the API, though, might want to offload all the crypto work onto subworkers. This could be done as follows:

```

function handleMessage(e) {
  if (e.data == "genkeys")
    genkeys(e.ports[0]);
  else if (e.data == "encrypt")
    encrypt(e.ports[0]);
  else if (e.data == "decrypt")
    decrypt(e.ports[0]);
}

function genkeys(p) {
  var generator = new Worker('libcrypto-v2-generator.js');
  generator.postMessage('', [p]);
}

function encrypt(p) {
  p.onmessage = function (e) {
    var key = e.data;
    var encryptor = new Worker('libcrypto-v2-encryptor.js');
    encryptor.postMessage(key, [p]);
  };
}

function decrypt(p) {
  p.onmessage = function (e) {
    var key = e.data;
    var decryptor = new Worker('libcrypto-v2-decryptor.js');
    decryptor.postMessage(key, [p]);
  };
}

// support being used as a shared worker as well as a dedicated worker
if ('onmessage' in this) // dedicated worker
  onmessage = handleMessage;
else // shared worker
  onconnect = function (e) { e.ports[0].onmessage = handleMessage };

```

The little subworkers would then be as follows.

For generating key pairs:

```
onmessage = function (e) {
  var k = _generateKeyPair();
  e.ports[0].postMessage(k[0]);
  e.ports[0].postMessage(k[1]);
  close();
}

function _generateKeyPair() {
  return [Math.random(), Math.random()];
}
```

For encrypting:

```
onmessage = function (e) {
  var key = e.data;
  e.ports[0].onmessage = function (e) {
    var s = e.data;
    postMessage(_encrypt(key, s));
  }
}

function _encrypt(k, s) {
  return 'encrypted-' + k + ' ' + s;
}
```

For decrypting:

```
onmessage = function (e) {
  var key = e.data;
  e.ports[0].onmessage = function (e) {
    var s = e.data;
    postMessage(_decrypt(key, s));
  }
}

function _decrypt(k, s) {
  return s.substr(s.indexOf(' ')+1);
}
```

Notice how the users of the API don't have to even know that this is happening — the API hasn't changed; the library can delegate to subworkers without changing its API, even though it is accepting data using message channels.

[View this example online.](#)

### 10.1.3 Tutorials <sup>§<sup>p12</sup><sub>26</sub></sup>

#### 10.1.3.1 Creating a dedicated worker <sup>§<sup>p12</sup><sub>26</sub></sup>

*This section is non-normative.*

Creating a worker requires a URL to a JavaScript file. The `Worker()` <sup>p1236</sup> constructor is invoked with the URL to that file as its only argument; a worker is then created and returned:

```
var worker = new Worker('helper.js');
```

If you want your worker script to be interpreted as a [module script](#) <sup>p1085</sup> instead of the default [classic script](#) <sup>p1085</sup>, you need to use a

slightly different signature:

```
var worker = new Worker('helper.mjs', { type: "module" });
```

### 10.1.3.2 Communicating with a dedicated worker §<sup>p12</sup><sub>27</sub>

*This section is non-normative.*

Dedicated workers use [MessagePort<sup>p1205</sup>](#) objects behind the scenes, and thus support all the same features, such as sending structured data, transferring binary data, and transferring other ports.

To receive messages from a dedicated worker, use the [onmessage<sup>p1205</sup>](#) [event handler IDL attribute<sup>p1137</sup>](#) on the [Worker<sup>p1236</sup>](#) object:

```
worker.onmessage = function (event) { ... };
```

You can also use the [addEventListener\(\)](#) method.

#### Note

The implicit [MessagePort<sup>p1205</sup>](#) used by dedicated workers has its [port message queue<sup>p1206</sup>](#) implicitly enabled when it is created, so there is no equivalent to the [MessagePort<sup>p1205</sup>](#) interface's [start\(\)<sup>p1208</sup>](#) method on the [Worker<sup>p1236</sup>](#) interface.

To send data to a worker, use the [postMessage\(\)<sup>p1236</sup>](#) method. Structured data can be sent over this communication channel. To send [ArrayBuffer](#) objects efficiently (by transferring them rather than cloning them), list them in an array in the second argument.

```
worker.postMessage({
  operation: 'find-edges',
  input: buffer, // an ArrayBuffer object
  threshold: 0.6,
}, [buffer]);
```

To receive a message inside the worker, the [onmessage<sup>p1205</sup>](#) [event handler IDL attribute<sup>p1137</sup>](#) is used.

```
onmessage = function (event) { ... };
```

You can again also use the [addEventListener\(\)](#) method.

In either case, the data is provided in the event object's [data<sup>p1189</sup>](#) attribute.

To send messages back, you again use [postMessage\(\)<sup>p1230</sup>](#). It supports the structured data in the same manner.

```
postMessage(event.data.input, [event.data.input]); // transfer the buffer back
```

### 10.1.3.3 Shared workers §<sup>p12</sup><sub>27</sub>

*This section is non-normative.*

Shared workers are identified by the URL of the script used to create it, optionally with an explicit name. The name allows multiple instances of a particular shared worker to be started.

Shared workers are scoped by [origin<sup>p898</sup>](#). Two different sites using the same names will not collide. However, if a page tries to use the same shared worker name as another page on the same site, but with a different script URL, it will fail.

Creating shared workers is done using the [SharedWorker\(\)<sup>p1237</sup>](#) constructor. This constructor takes the URL to the script to use for its first argument, and the name of the worker, if any, as the second argument.

```
var worker = new SharedWorker('service.js');
```

Communicating with shared workers is done with explicit [MessagePort](#)<sup>p1205</sup> objects. The object returned by the [SharedWorker\(\)](#)<sup>p1237</sup> constructor holds a reference to the port on its [port](#)<sup>p1237</sup> attribute.

```
worker.port.onmessage = function (event) { ... };
worker.port.postMessage('some message');
worker.port.postMessage({ foo: 'structured', bar: ['data', 'also', 'possible']});
```

Inside the shared worker, new clients of the worker are announced using the [connect](#)<sup>p1471</sup> event. The port for the new client is given by the event object's [source](#)<sup>p1190</sup> attribute.

```
onconnect = function (event) {
  var newPort = event.source;
  // set up a listener
  newPort.onmessage = function (event) { ... };
  // send a message back to the port
  newPort.postMessage('ready!'); // can also send structured data, of course
};
```

## 10.2 Infrastructure <sup>§ p12</sup><sub>28</sub>

This standard defines two kinds of workers: dedicated workers, and shared workers. Dedicated workers, once created, are linked to their creator, but message ports can be used to communicate from a dedicated worker to multiple other browsing contexts or workers. Shared workers, on the other hand, are named, and once created any script running in the same [origin](#)<sup>p898</sup> can obtain a reference to that worker and communicate with it. *Service Workers* defines a third kind. [\[SW\]](#)<sup>p1482</sup>

### 10.2.1 The global scope <sup>§ p12</sup><sub>28</sub>

The global scope is the "inside" of a worker.

#### 10.2.1.1 The [WorkerGlobalScope](#)<sup>p1228</sup> common interface <sup>§ p12</sup><sub>28</sub>

```
IDL [Exposed=Worker]
interface WorkerGlobalScope : EventTarget {
  readonly attribute WorkerGlobalScope self;
  readonly attribute WorkerLocation location;
  readonly attribute WorkerNavigator navigator;
  undefined importScripts((TrustedScriptURL or USVString)... urls);

  attribute OnErrorEventHandler onerror;
  attribute EventHandler onlanguagechange;
  attribute EventHandler onoffline;
  attribute EventHandler ononline;
  attribute EventHandler onrejectionhandled;
  attribute EventHandler onunhandledrejection;
};
```

[WorkerGlobalScope](#)<sup>p1228</sup> serves as the base class for specific types of worker global scope objects, including [DedicatedWorkerGlobalScope](#)<sup>p1230</sup>, [SharedWorkerGlobalScope](#)<sup>p1230</sup>, and [ServiceWorkerGlobalScope](#).

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **owner set** (a [set](#) of [Document](#)<sup>p130</sup> and [WorkerGlobalScope](#)<sup>p1228</sup> objects). It is initially empty and populated when the worker is created or obtained.

#### Note

*It is a [set](#), instead of a single owner, to accommodate [SharedWorkerGlobalScope](#)<sup>p1230</sup> objects.*

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **type** ("classic" or "module"). It is set during creation.

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **url** (null or a [URL](#)). It is initially null.

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **name** (a string). It is set during creation.

Note

The [name](#)<sup>p1229</sup> can have different semantics for each subclass of [WorkerGlobalScope](#)<sup>p1228</sup>. For [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> instances, it is simply a developer-supplied name, useful mostly for debugging purposes. For [SharedWorkerGlobalScope](#)<sup>p1230</sup> instances, it allows obtaining a reference to a common shared worker via the [SharedWorker\(\)](#)<sup>p1237</sup> constructor. For [ServiceWorkerGlobalScope](#) objects, it doesn't make sense (and as such isn't exposed through the JavaScript API at all).

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **policy container** (a [policy container](#)<sup>p917</sup>). It is initially a new [policy container](#)<sup>p917</sup>.

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **embedder policy** (an [embedder policy](#)<sup>p912</sup>).

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **module map**. It is a [module map](#)<sup>p1119</sup>, initially empty.

A [WorkerGlobalScope](#)<sup>p1228</sup> object has an associated **cross-origin isolated capability** boolean. It is initially false.

For web developers (non-normative)

```
workerGlobal.selfp1229  
Returns workerGlobal.  
  
workerGlobal.locationp1229  
Returns workerGlobal's WorkerLocationp1240 object.  
  
workerGlobal.navigatorp1240  
Returns workerGlobal's WorkerNavigatorp1240 object.  
  
workerGlobal.importScriptsp1239(...urls)  
Fetches each URL in urls, executes them one-by-one in the order they are passed, and then returns (or throws if something went amiss).
```

The **self** attribute must return the [WorkerGlobalScope](#)<sup>p1228</sup> object itself.

The **location** attribute must return the [WorkerLocation](#)<sup>p1240</sup> object whose associated [WorkerGlobalScope object](#)<sup>p1240</sup> is the [WorkerGlobalScope](#)<sup>p1228</sup> object.

Note

While the [WorkerLocation](#)<sup>p1240</sup> object is created after the [WorkerGlobalScope](#)<sup>p1228</sup> object, this is not problematic as it cannot be observed from script.

The following are the [event handlers](#)<sup>p1136</sup> (and their corresponding [event handler event types](#)<sup>p1139</sup>) that must be supported, as [event handler IDL attributes](#)<sup>p1137</sup>, by objects implementing the [WorkerGlobalScope](#)<sup>p1228</sup> interface:

Event handler <sup>p1136</sup>	Event handler event type <sup>p1139</sup>
<b>onerror</b>	<a href="#">error</a> <sup>p1471</sup>
<b>onlanguagechange</b>	<a href="#">languagechange</a> <sup>p1471</sup>
<b>onoffline</b>	<a href="#">offline</a> <sup>p1472</sup>
<b>ononline</b>	<a href="#">online</a> <sup>p1472</sup>
<b>onrejectionhandled</b>	<a href="#">rejectionhandled</a> <sup>p1472</sup>
<b>onunhandledrejection</b>	<a href="#">unhandledrejection</a> <sup>p1472</sup>

10.2.1.2 Dedicated workers and the [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> interface §<sup>p12</sup><sub>29</sub>

IDL [Global=([Worker](#),[DedicatedWorker](#)), Exposed=[DedicatedWorker](#)]

```
interface DedicatedWorkerGlobalScope : WorkerGlobalScope {
  [Replaceable] readonly attribute DOMString name;

  undefined postMessage(any message, sequence<object> transfer);
  undefined postMessage(any message, optional StructuredSerializeOptions options = {});

  undefined close();
};

DedicatedWorkerGlobalScope includes MessageEventTarget;
```

[DedicatedWorkerGlobalScope](#)<sup>p1230</sup> objects have an associated **inside port** (a [MessagePort](#)<sup>p1205</sup>). This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> object.

#### For web developers (non-normative)

**[dedicatedWorkerGlobal.name](#)**<sup>p1230</sup>

Returns *dedicatedWorkerGlobal*'s [name](#)<sup>p1229</sup>, i.e. the value given to the [Worker](#)<sup>p1236</sup> constructor. Primarily useful for debugging.

**[dedicatedWorkerGlobal.postMessage](#)**<sup>p1230</sup>(*message* [, *transfer* ])

**[dedicatedWorkerGlobal.postMessage](#)**<sup>p1230</sup>(*message* [, { [transfer](#)<sup>p1205</sup> } ])

Clones *message* and transmits it to the [Worker](#)<sup>p1236</sup> object associated with *dedicatedWorkerGlobal*. *transfer* can be passed as a list of objects that are to be transferred rather than cloned.

**[dedicatedWorkerGlobal.close](#)**<sup>p1230</sup>()

Aborts *dedicatedWorkerGlobal*.

The **name** getter steps are to return [this](#)'s [name](#)<sup>p1229</sup>. Its value represents the name given to the worker using the [Worker](#)<sup>p1236</sup> constructor, used primarily for debugging purposes.

The **postMessage(*message*, *transfer*)** and **postMessage(*message*, *options*)** methods on [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> objects act as if, when invoked, it immediately invoked the respective [postMessage\(\*message\*, \*transfer\*\)](#)<sup>p1208</sup> and [postMessage\(\*message\*, \*options\*\)](#)<sup>p1208</sup> on the port, with the same arguments, and returned the same return value.

To **close a worker**, given a *workerGlobal*, run these steps:

1. Discard any [tasks](#)<sup>p1124</sup> that have been added to *workerGlobal*'s [relevant agent](#)<sup>p1073</sup>'s [event loop](#)<sup>p1123</sup>'s [task queues](#)<sup>p1123</sup>.
2. Set *workerGlobal*'s [closing](#)<sup>p1231</sup> flag to true. (This prevents any further tasks from being queued.)

The **close()** method steps are to [close a worker](#)<sup>p1230</sup> given [this](#).

### 10.2.1.3 Shared workers and the [SharedWorkerGlobalScope](#)<sup>p1230</sup> interface §<sup>p12</sup><sub>30</sub>

IDL [Global=([Worker](#),[SharedWorker](#)),Exposed=[SharedWorker](#)]  
 interface [SharedWorkerGlobalScope](#) : [WorkerGlobalScope](#) {  
 [Replaceable] readonly attribute DOMString name;  
  
 undefined close();  
  
 attribute [EventHandler](#) onconnect;  
 };

A [SharedWorkerGlobalScope](#)<sup>p1230</sup> object has an associated **constructor origin**, **constructor url**, and **credentials**. They are initialized when the [SharedWorkerGlobalScope](#)<sup>p1230</sup> object is created, in the [run a worker](#)<sup>p1232</sup> algorithm.

Shared workers receive message ports through [connect](#)<sup>p1471</sup> events on their [SharedWorkerGlobalScope](#)<sup>p1230</sup> object for each connection.

For web developers (non-normative)

**`sharedWorkerGlobal.name`**<sup>p1231</sup>

Returns `sharedWorkerGlobal`'s `name`<sup>p1229</sup>, i.e. the value given to the `SharedWorker`<sup>p1237</sup> constructor. Multiple `SharedWorker`<sup>p1237</sup> objects can correspond to the same shared worker (and `SharedWorkerGlobalScope`<sup>p1230</sup>), by reusing the same name.

**`sharedWorkerGlobal.close`**<sup>p1231</sup> ()

Aborts `sharedWorkerGlobal`.

The `name` getter steps are to return `this`'s `name`<sup>p1229</sup>. Its value represents the name that can be used to obtain a reference to the worker using the `SharedWorker`<sup>p1237</sup> constructor.

The `close()` method steps are to `close a worker`<sup>p1230</sup> given `this`.

The following are the `event handlers`<sup>p1136</sup> (and their corresponding `event handler event types`<sup>p1139</sup>) that must be supported, as `event handler IDL attributes`<sup>p1137</sup>, by objects implementing the `SharedWorkerGlobalScope`<sup>p1230</sup> interface:

<code>Event handler</code> <sup>p1136</sup>	<code>Event handler event type</code> <sup>p1139</sup>
<code>onconnect</code>	<code>connect</code> <sup>p1471</sup>

## 10.2.2 The event loop <sup>§ p1231</sup>

A `worker event loop`<sup>p1123</sup>'s `task queues`<sup>p1123</sup> only have events, callbacks, and networking activity as `tasks`<sup>p1124</sup>. These `worker event loops`<sup>p1123</sup> are created by the `run a worker`<sup>p1232</sup> algorithm.

Each `WorkerGlobalScope`<sup>p1228</sup> object has a **closing** flag, which must be initially false, but which can get set to true by the algorithms in the processing model section below.

Once the `WorkerGlobalScope`<sup>p1228</sup>'s `closing`<sup>p1231</sup> flag is set to true, the `event loop`<sup>p1123</sup>'s `task queues`<sup>p1123</sup> must discard any further `tasks`<sup>p1124</sup> that would be added to them (tasks already on the queue are unaffected except where otherwise specified). Effectively, once the `closing`<sup>p1231</sup> flag is true, timers stop firing, notifications for all pending background operations are dropped, etc.

## 10.2.3 The worker's lifetime <sup>§ p1231</sup>

Workers communicate with other workers and with `Window`<sup>p922</sup>s through `message channels`<sup>p1202</sup> and their `MessagePort`<sup>p1205</sup> objects.

Each `WorkerGlobalScope`<sup>p1228</sup> object *worker global scope* has a list of **the worker's ports**, which consists of all the `MessagePort`<sup>p1205</sup> objects that are entangled with another port and that have one (but only one) port owned by *worker global scope*. This list includes the implicit `MessagePort`<sup>p1205</sup> in the case of `dedicated workers`<sup>p1230</sup>.

Given an `environment settings object`<sup>p1076</sup> *o* when creating or obtaining a worker, the **relevant owner to add** depends on the type of `global object`<sup>p1077</sup> specified by *o*. If *o*'s `global object`<sup>p1077</sup> is a `WorkerGlobalScope`<sup>p1228</sup> object (i.e., if we are creating a nested dedicated worker), then the relevant owner is that global object. Otherwise, *o*'s `global object`<sup>p1077</sup> is a `Window`<sup>p922</sup> object, and the relevant owner is that `Window`<sup>p922</sup>'s `associated Document`<sup>p923</sup>.

A worker is said to be a **permissible worker** if its `WorkerGlobalScope`<sup>p1228</sup>'s `owner set`<sup>p1228</sup> is not `empty` or:

- its `owner set`<sup>p1228</sup> has been `empty` for no more than a short `implementation-defined` timeout value,
- its `WorkerGlobalScope`<sup>p1228</sup> object is a `SharedWorkerGlobalScope`<sup>p1230</sup> object (i.e., the worker is a shared worker), and
- the user agent has a `navigable`<sup>p989</sup> whose `active document`<sup>p989</sup> is not `completely loaded`<sup>p1063</sup>.

### Note

*The second part of this definition allows a shared worker to survive for a short time while a page is loading, in case that page is going to contact the shared worker again. This can be used by user agents as a way to avoid the cost of restarting a shared worker used by a site when the user is navigating from page to page within that site.*

A worker is said to be an **active needed worker** if any of its `owners`<sup>p1228</sup> are either `Document`<sup>p130</sup> objects that are `fully active`<sup>p1003</sup> or

[active needed workers](#)<sup>p1231</sup>.

A worker is said to be a **protected worker** if it is an [active needed worker](#)<sup>p1231</sup> and either it has outstanding timers, database transactions, or network connections, or its list of [the worker's ports](#)<sup>p1231</sup> is not empty, or its [WorkerGlobalScope](#)<sup>p1228</sup> is actually a [SharedWorkerGlobalScope](#)<sup>p1230</sup> object (i.e., the worker is a shared worker).

A worker is said to be a **suspendable worker** if it is not an [active needed worker](#)<sup>p1231</sup> but it is a [permissible worker](#)<sup>p1231</sup>.

#### 10.2.4 Processing model <sup>p12</sup><sub>32</sub>

When a user agent is to **run a worker** for a script with [Worker](#)<sup>p1236</sup> or [SharedWorker](#)<sup>p1237</sup> object *worker*, [URL](#) *url*, [environment settings object](#)<sup>p1076</sup> *outside settings*, [MessagePort](#)<sup>p1205</sup> *outside port*, and a [WorkerOptions](#)<sup>p1236</sup> dictionary *options*, it must run the following steps.

1. Let *is shared* be true if *worker* is a [SharedWorker](#)<sup>p1237</sup> object, and false otherwise.
2. Let *owner* be the [relevant owner to add](#)<sup>p1231</sup> given *outside settings*.
3. Let *unsafeWorkerCreationTime* be the [unsafe shared current time](#).
4. Let *agent* be the result of [obtaining a dedicated/shared worker agent](#)<sup>p1074</sup> given *outside settings* and *is shared*. Run the rest of these steps in that agent.
5. Let *realm execution context* be the result of [creating a new realm](#)<sup>p1077</sup> given *agent* and the following customizations:
  - For the global object, if *is shared* is true, create a new [SharedWorkerGlobalScope](#)<sup>p1230</sup> object. Otherwise, create a new [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> object.
6. Let *worker global scope* be the [global object](#)<sup>p1077</sup> of *realm execution context*'s Realm component.

#### Note

This is the [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> or [SharedWorkerGlobalScope](#)<sup>p1230</sup> object created in the previous step.

7. [Set up a worker environment settings object](#)<sup>p1235</sup> with *realm execution context*, *outside settings*, and *unsafeWorkerCreationTime*, and let *inside settings* be the result.
  8. Set *worker global scope*'s [name](#)<sup>p1229</sup> to the value of *options*'s *name* member.
  9. [Append](#) *owner* to *worker global scope*'s [owner set](#)<sup>p1228</sup>.
  10. If *is shared* is true, then:
    1. Set *worker global scope*'s [constructor origin](#)<sup>p1230</sup> to *outside settings*'s [origin](#)<sup>p1076</sup>.
    2. Set *worker global scope*'s [constructor url](#)<sup>p1230</sup> to *url*.
    3. Set *worker global scope*'s [type](#)<sup>p1229</sup> to the value of *options*'s *type* member.
    4. Set *worker global scope*'s [credentials](#)<sup>p1230</sup> to the value of *options*'s *credentials* member.
  11. Let *destination* be "sharedworker" if *is shared* is true, and "worker" otherwise.
  12. Obtain *script* by switching on the value of *options*'s *type* member:
    - ↪ "classic"  
[Fetch a classic worker script](#)<sup>p1088</sup> given *url*, *outside settings*, *destination*, *inside settings*, and with *onComplete* and *performFetch* as defined below.
    - ↪ "module"  
[Fetch a module worker script graph](#)<sup>p1090</sup> given *url*, *outside settings*, *destination*, the value of the *credentials* member of *options*, *inside settings*, and with *onComplete* and *performFetch* as defined below.
- In both cases, let *performFetch* be the following [perform the fetch hook](#)<sup>p1087</sup> given *request*, [isTopLevel](#)<sup>p1087</sup> and [processCustomFetchResponse](#)<sup>p1087</sup>:
1. If *isTopLevel* is false, [fetch](#) *request* with [processResponseConsumeBody](#) set to *processCustomFetchResponse*, and

abort these steps.

2. Set request's [reserved client](#) to *inside settings*.
  3. [Fetch](#) request with [processResponseConsumeBody](#) set to the following steps given [response](#) response and null, failure, or a [byte sequence](#) *bodyBytes*:
    1. Set worker global scope's [url](#)<sup>p1229</sup> to response's [url](#).
    2. [Initialize worker global scope's policy container](#)<sup>p918</sup> given worker global scope, response, and *inside settings*.
    3. If the [Run CSP initialization for a global object](#) algorithm returns "Blocked" when executed upon worker global scope, set response to a [network error](#). [[CSP](#)]<sup>p1476</sup>
    4. If worker global scope's [embedder policy](#)<sup>p1229</sup>'s [value](#)<sup>p912</sup> is [compatible with cross-origin isolation](#)<sup>p912</sup> and *is shared* is true, then set agent's [agent cluster](#)'s [cross-origin isolation mode](#)<sup>p1073</sup> to "[logical](#)<sup>p1002</sup>" or "[concrete](#)<sup>p1002</sup>". The one chosen is [implementation-defined](#).
- This really ought to be set when the agent cluster is created, which requires a redesign of this section.
5. If the result of [checking a global object's embedder policy](#)<sup>p914</sup> with worker global scope, *outside settings*, and response is false, then set response to a [network error](#).
  6. Set worker global scope's [cross-origin isolated capability](#)<sup>p1229</sup> to true if agent's [agent cluster](#)'s [cross-origin isolation mode](#)<sup>p1073</sup> is "[concrete](#)<sup>p1002</sup>".
  7. If *is shared* is false and owner's [cross-origin isolated capability](#)<sup>p1076</sup> is false, then set worker global scope's [cross-origin isolated capability](#)<sup>p1229</sup> to false.
  8. If *is shared* is false and response's [url](#)'s [scheme](#) is "data", then set worker global scope's [cross-origin isolated capability](#)<sup>p1229</sup> to false.

**Note**

*This is a conservative default for now, while we figure out how workers in general, and [data:](#) URL workers in particular (which are cross-origin from their owner), will be treated in the context of permissions policies. See [w3c/webappsec-permissions-policy issue #207](#) for more details.*

9. Run [processCustomFetchResponse](#) with response and *bodyBytes*.

In both cases, let *onComplete* given *script* be the following steps:

1. If *script* is null or if *script*'s [error to rethrow](#)<sup>p1084</sup> is non-null, then:
  1. [Queue a global task](#)<sup>p1125</sup> on the [DOM manipulation task source](#)<sup>p1134</sup> given worker's [relevant global object](#)<sup>p1083</sup> to [fire an event](#) named [error](#)<sup>p1471</sup> at worker.
  2. Run the [environment discarding steps](#)<sup>p1076</sup> for *inside settings*.
  3. Abort these steps.
2. Associate worker with worker global scope.
3. Let *inside port* be a [new MessagePort](#)<sup>p1205</sup> object in *inside settings*'s [realm](#)<sup>p1077</sup>.
4. If *shared* is false, then:
  1. Set *inside port*'s [message event target](#)<sup>p1206</sup> to worker global scope.
  2. Set worker global scope's [inside port](#)<sup>p1230</sup> to *inside port*.
5. [Entangle](#)<sup>p1206</sup> *outside port* and *inside port*.
6. Create a new [WorkerLocation](#)<sup>p1240</sup> object and associate it with worker global scope.
7. **Closing orphan workers:** Start monitoring the worker such that no sooner than it stops being a [protected worker](#)<sup>p1232</sup>, and no later than it stops being a [permissible worker](#)<sup>p1231</sup>, worker global scope's [closing](#)<sup>p1231</sup> flag is set to true.

8. **Suspending workers:** Start monitoring the worker, such that whenever *worker global scope*'s [closing](#)<sup>p1231</sup> flag is false and the worker is a [suspendable worker](#)<sup>p1232</sup>, the user agent suspends execution of script in that worker until such time as either the [closing](#)<sup>p1231</sup> flag switches to true or the worker stops being a [suspendable worker](#)<sup>p1232</sup>.
9. Set *inside settings*'s [execution ready flag](#)<sup>p1076</sup>.
10. If *script* is a [classic script](#)<sup>p1085</sup>, then [run the classic script](#)<sup>p1096</sup> *script*. Otherwise, it is a [module script](#)<sup>p1085</sup>; [run the module script](#)<sup>p1096</sup> *script*.

#### Note

*In addition to the usual possibilities of returning a value or failing due to an exception, this could be [prematurely aborted](#)<sup>p1097</sup> by the [terminate a worker](#)<sup>p1234</sup> algorithm defined below.*

11. Enable *outside port*'s [port message queue](#)<sup>p1206</sup>.
12. If *is shared* is false, enable the [port message queue](#)<sup>p1206</sup> of the worker's implicit port.
13. If *is shared* is true, then [queue a global task](#)<sup>p1125</sup> on [DOM manipulation task source](#)<sup>p1134</sup> given *worker global scope* to [fire an event](#) named [connect](#)<sup>p1471</sup> at *worker global scope*, using [MessageEvent](#)<sup>p1189</sup>, with the [data](#)<sup>p1189</sup> attribute initialized to the empty string, the [ports](#)<sup>p1190</sup> attribute initialized to a new [frozen array](#) containing *inside port*, and the [source](#)<sup>p1190</sup> attribute initialized to *inside port*.
14. Enable the [client message queue](#) of the [ServiceWorkerContainer](#) object whose associated [service worker client](#) is *worker global scope*'s [relevant settings object](#)<sup>p1083</sup>.
15. **Event loop:** Run the [responsible event loop](#)<sup>p1076</sup> specified by *inside settings* until it is destroyed.

#### Note

*The handling of events or the execution of callbacks by [tasks](#)<sup>p1124</sup> run by the [event loop](#)<sup>p1123</sup> might get [prematurely aborted](#)<sup>p1097</sup> by the [terminate a worker](#)<sup>p1234</sup> algorithm defined below.*

#### Note

*The worker processing model remains on this step until the event loop is destroyed, which happens after the [closing](#)<sup>p1231</sup> flag is set to true, as described in the [event loop](#)<sup>p1123</sup> processing model.*

16. [Clear](#) the *worker global scope*'s [map of active timers](#)<sup>p1164</sup>.
17. Disentangle all the ports in the list of [the worker's ports](#)<sup>p1231</sup>.
18. [Empty](#) *worker global scope*'s [owner set](#)<sup>p1228</sup>.

When a user agent is to **terminate a worker** it must run the following steps [in parallel](#)<sup>p43</sup> with the worker's main loop (the "[run a worker](#)<sup>p1232</sup>" processing model defined above):

1. Set the worker's [WorkerGlobalScope](#)<sup>p1228</sup> object's [closing](#)<sup>p1231</sup> flag to true.
2. If there are any [tasks](#)<sup>p1124</sup> queued in the [WorkerGlobalScope](#)<sup>p1228</sup> object's [relevant agent](#)<sup>p1073</sup>'s [event loop](#)<sup>p1123</sup>'s [task queues](#)<sup>p1123</sup>, discard them without processing them.
3. [Abort the script](#)<sup>p1097</sup> currently running in the worker.
4. If the worker's [WorkerGlobalScope](#)<sup>p1228</sup> object is actually a [DedicatedWorkerGlobalScope](#)<sup>p1230</sup> object (i.e. the worker is a dedicated worker), then empty the [port message queue](#)<sup>p1206</sup> of the port that the worker's implicit port is entangled with.

User agents may invoke the [terminate a worker](#)<sup>p1234</sup> algorithm when a worker stops being an [active needed worker](#)<sup>p1231</sup> and the worker continues executing even after its [closing](#)<sup>p1231</sup> flag was set to true.

## 10.2.5 Runtime script errors <sup>p12</sup><sub>34</sub>

Whenever an uncaught runtime script error occurs in one of the worker's scripts, if the error did not occur while handling a previous script error, the user agent will [report](#)<sup>p1098</sup> it for the worker's [WorkerGlobalScope](#)<sup>p1228</sup> object.

10.2.6 Creating workers § p12 35

10.2.6.1 The AbstractWorker p1235 mixin § p12 35

IDL

```
interface mixin AbstractWorker {  
  attribute EventHandler onerror;  
};
```

The following are the [event handlers](#) p1136 (and their corresponding [event handler event types](#) p1139) that must be supported, as [event handler IDL attributes](#) p1137, by objects implementing the [AbstractWorker](#) p1235 interface:

<a href="#">Event handler</a> p1136	<a href="#">Event handler event type</a> p1139
<a href="#">onerror</a>	<a href="#">error</a> p1471

10.2.6.2 Script settings for workers § p12 35

To **set up a worker environment settings object**, given a [JavaScript execution context](#) *execution context*, an [environment settings object](#) p1076 *outside settings*, and a number *unsafeWorkerCreationTime*:

1. Let *inherited origin* be *outside settings*'s [origin](#) p1076.
2. Let *realm* be the value of *execution context*'s *Realm* component.
3. Let *worker global scope* be *realm*'s [global object](#) p1077.
4. Let *settings object* be a new [environment settings object](#) p1076 whose algorithms are defined as follows:

**The [realm execution context](#) p1076**  
Return *execution context*.

**The [module map](#) p1076**  
Return *worker global scope*'s [module map](#) p1229.

**The [API base URL](#) p1076**  
Return *worker global scope*'s [url](#) p1229.

**The [origin](#) p1076**  
Return a unique [opaque origin](#) p898 if *worker global scope*'s [url](#) p1229's [scheme](#) is "data", and *inherited origin* otherwise.

**The [policy container](#) p1076**  
Return *worker global scope*'s [policy container](#) p1229.

**The [cross-origin isolated capability](#) p1076**  
Return *worker global scope*'s [cross-origin isolated capability](#) p1229.

**The [time origin](#) p1076**  
Return the result of [coarsening](#) *unsafeWorkerCreationTime* with *worker global scope*'s [cross-origin isolated capability](#) p1229.

5. Set *settings object*'s [id](#) p1075 to a new unique opaque string, [creation URL](#) p1075 to *worker global scope*'s [url](#), [top-level creation URL](#) p1075 to null, [target browsing context](#) p1076 to null, and [active service worker](#) p1076 to null.
6. If *worker global scope* is a [DedicatedWorkerGlobalScope](#) p1230 object, then set *settings object*'s [top-level origin](#) p1076 to *outside settings*'s [top-level origin](#) p1076.
7. Otherwise, set *settings object*'s [top-level origin](#) p1076 to an [implementation-defined](#) value.

See [Client-Side Storage Partitioning](#) for the latest on properly defining this.

8. Set *realm*'s *[[HostDefined]]* field to *settings object*.
9. Return *settings object*.

### 10.2.6.3 Dedicated workers and the [Worker<sup>p1236</sup>](#) interface <sup>§<sup>p12</sup> 36</sup>

IDL

```
[Exposed=(Window,DedicatedWorker,SharedWorker)]
interface Worker : EventTarget {
  constructor((TrustedScriptURL or USVString) scriptURL, optional WorkerOptions options = {});

  undefined terminate();

  undefined postMessage(any message, sequence<object> transfer);
  undefined postMessage(any message, optional StructuredSerializeOptions options = {});
};

dictionary WorkerOptions {
  WorkerType type = "classic";
  RequestCredentials credentials = "same-origin"; // credentials is only used if type is "module"
  DOMString name = "";
};

enum WorkerType { "classic", "module" };

Worker includes AbstractWorker;
Worker includes MessageEventTarget;
```

#### For web developers (non-normative)

**`worker = new Workerp1236(scriptURL [, options ])`**

Returns a new [Worker<sup>p1236</sup>](#) object. *scriptURL* will be fetched and executed in the background, creating a new global environment for which *worker* represents the communication channel. *options* can be used to define the [name<sup>p1229</sup>](#) of that global environment via the `name` option, primarily for debugging purposes. It can also ensure this new global environment supports JavaScript modules (specify `type: "module"`), and if that is specified, can also be used to specify how *scriptURL* is fetched through the `credentials` option.

**`worker.terminatep1236()`**

Aborts *worker*'s associated global environment.

**`worker.postMessagep1236(message [, transfer ])`**

**`worker.postMessagep1236(message [, { transferp1205 } ])`**

Clones *message* and transmits it to *worker*'s global environment. *transfer* can be passed as a list of objects that are to be transferred rather than cloned.

Each [Worker<sup>p1236</sup>](#) object has an associated **outside port** (a [MessagePort<sup>p1205</sup>](#)). This port is part of a channel that is set up when the worker is created, but it is not exposed. This object must never be garbage collected before the [Worker<sup>p1236</sup>](#) object.

The **`terminate()`** method, when invoked, must cause the [terminate a worker<sup>p1234</sup>](#) algorithm to be run on the worker with which the object is associated.

The **`postMessage(message, transfer)`** and **`postMessage(message, options)`** methods on [Worker<sup>p1236</sup>](#) objects act as if, when invoked, they immediately invoked the respective [postMessage\(message, transfer\)<sup>p1208</sup>](#) and [postMessage\(message, options\)<sup>p1208</sup>](#) on [this's outside port<sup>p1236</sup>](#), with the same arguments, and returned the same return value.

#### Example

The **`postMessage()p1236`** method's first argument can be structured data:

```
worker.postMessage({opcode: 'activate', device: 1938, parameters: [23, 102]});
```

When the **`Worker(scriptURL, options)`** constructor is invoked, the user agent must run the following steps:

1. Let *compliantScriptURL* be the result of invoking the [Get Trusted Type compliant string](#) algorithm with [TrustedScriptURL](#), [this's relevant global object<sup>p1083</sup>](#), *scriptURL*, "Worker constructor", and "script".
2. Let *outside settings* be the [current settings object<sup>p1083</sup>](#).

- Let *worker URL* be the result of [encoding-parsing a URL](#)<sup>p97</sup> given *compliantScriptURL*, relative to *outside settings*.

#### Note

Any [same-origin](#)<sup>p899</sup> URL (including [blob:](#) URLs) can be used. [data:](#) URLs can also be used, but they create a worker with an [opaque origin](#)<sup>p898</sup>.

- If *worker URL* is failure, then throw a ["SyntaxError" DOMException](#).
- Let *worker* be a new [Worker](#)<sup>p1236</sup> object.
- Let *outside port* be a new [MessagePort](#)<sup>p1205</sup> in *outside settings*'s [realm](#)<sup>p1077</sup>.
- Set *outside port*'s [message event target](#)<sup>p1206</sup> to *worker*.
- Set *worker*'s [outside port](#)<sup>p1236</sup> to *outside port*.
- Run this step [in parallel](#)<sup>p43</sup>:
  - [Run a worker](#)<sup>p1232</sup> given *worker*, *worker URL*, *outside settings*, *outside port*, and *options*.
- Return *worker*.

### 10.2.6.4 Shared workers and the [SharedWorker](#)<sup>p1237</sup> interface §<sup>p12</sup> 37

IDL [Exposed=Window]

```
interface SharedWorker : EventTarget {
  constructor((TrustedScriptURL or USVString) scriptURL, optional (DOMString or WorkerOptions) options = {});

  readonly attribute MessagePort port;
};
SharedWorker includes AbstractWorker;
```

#### For web developers (non-normative)

***sharedWorker* = new [SharedWorker](#)<sup>p1237</sup>(*scriptURL* [, *name* ])**

Returns a new [SharedWorker](#)<sup>p1237</sup> object. *scriptURL* will be fetched and executed in the background, creating a new global environment for which *sharedWorker* represents the communication channel. *name* can be used to define the [name](#)<sup>p1229</sup> of that global environment.

***sharedWorker* = new [SharedWorker](#)<sup>p1237</sup>(*scriptURL* [, *options* ])**

Returns a new [SharedWorker](#)<sup>p1237</sup> object. *scriptURL* will be fetched and executed in the background, creating a new global environment for which *sharedWorker* represents the communication channel. *options* can be used to define the [name](#)<sup>p1229</sup> of that global environment via the *name* option. It can also ensure this new global environment supports JavaScript modules (specify type: "module"), and if that is specified, can also be used to specify how *scriptURL* is fetched through the *credentials* option. Note that attempting to construct a shared worker with *options* whose *type* or *credentials* values mismatch an existing shared worker will cause the returned *sharedWorker* to fire an error event and not connect to the existing shared worker.

***sharedWorker*.[port](#)<sup>p1237</sup>**

Returns *sharedWorker*'s [MessagePort](#)<sup>p1205</sup> object which can be used to communicate with the global environment.

The **port** attribute must return the value it was assigned by the object's constructor. It represents the [MessagePort](#)<sup>p1205</sup> for communicating with the shared worker.

A user agent has an associated **shared worker manager** which is the result of [starting a new parallel queue](#)<sup>p43</sup>.

#### Note

Each user agent has a single [shared worker manager](#)<sup>p1237</sup> for simplicity. Implementations could use one per [origin](#)<sup>p898</sup>; that would not be observably different and enables more concurrency.

When the **[SharedWorker](#)(*scriptURL*, *options*)** constructor is invoked:

1. Let *compliantScriptURL* be the result of invoking the [Get Trusted Type compliant string](#) algorithm with *TrustedScriptURL*, this's [relevant global object](#)<sup>p1083</sup>, *scriptURL*, "SharedWorker constructor", and "script".
2. If *options* is a [DOMString](#), set *options* to a new [WorkerOptions](#)<sup>p1236</sup> dictionary whose *name* member is set to the value of *options* and whose other members are set to their default values.
3. Let *outside settings* be the [current settings object](#)<sup>p1083</sup>.
4. Let *urlRecord* be the result of [encoding-parsing a URL](#)<sup>p97</sup> given *compliantScriptURL*, relative to *outside settings*.

#### Note

Any [same-origin](#)<sup>p899</sup> URL (including [blob:](#) URLs) can be used. [data:](#) URLs can also be used, but they create a worker with an [opaque origin](#)<sup>p898</sup>.

5. If *urlRecord* is failure, then throw a ["SyntaxError" DOMException](#).
  6. Let *worker* be a new [SharedWorker](#)<sup>p1237</sup> object.
  7. Let *outside port* be a new [MessagePort](#)<sup>p1205</sup> in *outside settings*'s [realm](#)<sup>p1077</sup>.
  8. Assign *outside port* to the [port](#)<sup>p1237</sup> attribute of *worker*.
  9. Let *callerIsSecureContext* be true if *outside settings* is a [secure context](#)<sup>p1084</sup>; otherwise, false.
  10. Let *outside storage key* be the result of running [obtain a storage key for non-storage purposes](#) given *outside settings*.
  11. [Enqueue the following steps](#)<sup>p43</sup> to the [shared worker manager](#)<sup>p1237</sup>:
    1. Let *worker global scope* be null.
    2. [For each](#) scope in the list of all [SharedWorkerGlobalScope](#)<sup>p1230</sup> objects:
      1. Let *worker storage key* be the result of running [obtain a storage key for non-storage purposes](#) given scope's [relevant settings object](#)<sup>p1083</sup>.
      2. If all of the following are true:
        - *worker storage key* [equals](#) *outside storage key*;
        - scope's [closing](#)<sup>p1231</sup> flag is false;
        - scope's [constructor url](#)<sup>p1230</sup> [equals](#) *urlRecord*; and
        - scope's [name](#)<sup>p1229</sup> equals the value of *option*'s *name* member,
- then:
1. Set *worker global scope* to *scope*.
  2. [Break](#).

#### Note

[data:](#) URLs create a worker with an [opaque origin](#)<sup>p898</sup>. Both the [constructor origin](#)<sup>p1230</sup> and [constructor url](#)<sup>p1230</sup> are compared so the same [data:](#) URL can be used within an [origin](#)<sup>p898</sup> to get to the same [SharedWorkerGlobalScope](#)<sup>p1230</sup> object, but cannot be used to bypass the [same origin](#)<sup>p899</sup> restriction.

3. If *worker global scope* is not null, but the user agent has been configured to disallow communication between the worker represented by the *worker global scope* and the [scripts](#)<sup>p1084</sup> whose [settings object](#)<sup>p1084</sup> is *outside settings*, then set *worker global scope* to null.

#### Note

For example, a user agent could have a development mode that isolates a particular [top-level traversable](#)<sup>p990</sup> from all other pages, and scripts in that development mode could be blocked from connecting to shared workers running in the normal browser mode.

4. If *worker global scope* is not null, then check if *worker global scope*'s [type](#)<sup>p1229</sup> and [credentials](#)<sup>p1230</sup> match the *options* values. If not, [queue a task](#)<sup>p1125</sup> to [fire an event](#) named [error](#)<sup>p1471</sup> and abort these steps.
5. If *worker global scope* is not null, then run these substeps:

1. Let *settings object* be the [relevant settings object](#)<sup>p1083</sup> for *worker global scope*.
2. Let *workerIsSecureContext* be true if *settings object* is a [secure context](#)<sup>p1084</sup>; otherwise, false.
3. If *workerIsSecureContext* is not *callerIsSecureContext*, then [queue a task](#)<sup>p1125</sup> to [fire an event](#) named [error](#)<sup>p1471</sup> at *worker* and abort these steps. [\[SECURE-CONTEXTS\]](#)<sup>p1482</sup>
4. Associate *worker* with *worker global scope*.
5. Let *inside port* be a [new MessagePort](#)<sup>p1205</sup> in *settings object*'s [realm](#)<sup>p1077</sup>.
6. [Entangle](#)<sup>p1206</sup> *outside port* and *inside port*.
7. [Queue a task](#)<sup>p1125</sup>, using the [DOM manipulation task source](#)<sup>p1134</sup>, to [fire an event](#) named [connect](#)<sup>p1471</sup> at *worker global scope*, using [MessageEvent](#)<sup>p1189</sup>, with the [data](#)<sup>p1189</sup> attribute initialized to the empty string, the [ports](#)<sup>p1190</sup> attribute initialized to a new [frozen array](#) containing only *inside port*, and the [source](#)<sup>p1190</sup> attribute initialized to *inside port*.
8. [Append](#) the [relevant owner to add](#)<sup>p1231</sup> given *outside settings* to *worker global scope*'s [owner set](#)<sup>p1228</sup>.
6. Otherwise, [in parallel](#)<sup>p43</sup>, [run a worker](#)<sup>p1232</sup> given *worker*, *urlRecord*, *outside settings*, *outside port*, and *options*.
12. Return *worker*.

## 10.2.7 Concurrent hardware capabilities <sup>§ p1239</sup>

```
IDL interface mixin NavigatorConcurrentHardware {
  readonly attribute unsigned long long hardwareConcurrency;
};
```

For web developers (non-normative)

```
self.navigatorp1170.hardwareConcurrencyp1239
```

Returns the number of logical processors potentially available to the user agent.

The **navigator.hardwareConcurrency** attribute's getter must return a number between 1 and the number of logical processors potentially available to the user agent. If this cannot be determined, the getter must return 1.

User agents should err toward exposing the number of logical processors available, using lower values only in cases where there are user-agent specific limits in place (such as a limitation on the number of [workers](#)<sup>p1236</sup> that can be created) or when the user agent desires to limit fingerprinting possibilities.

## 10.3 APIs available to workers <sup>§ p1239</sup>

### 10.3.1 Importing scripts and libraries <sup>§ p1239</sup>

The **importScripts(...urls)** method steps are:

1. Let *urlStrings* be « ».
2. [For each](#) *url* of *urls*:
  1. [Append](#) the result of invoking the [Get Trusted Type compliant string](#) algorithm with [TrustedScriptURL](#), [this's relevant global object](#)<sup>p1083</sup>, *url*, "Worker importScripts", and "script" to *urlStrings*.
3. [Import scripts into worker global scope](#)<sup>p1239</sup> given [this](#) and *urlStrings*.

To **import scripts into worker global scope**, given a [WorkerGlobalScope](#)<sup>p1228</sup> object *worker global scope*, a [list](#) of [scalar value strings](#) *urls*, and an optional [perform the fetch hook](#)<sup>p1087</sup> *performFetch*:

1. If *worker global scope*'s [type](#)<sup>p1229</sup> is "module", throw a [TypeError](#) exception.

2. Let *settings object* be the [current settings object](#)<sup>p1083</sup>.
3. If *urls* is empty, return.
4. Let *urlRecords* be « ».
5. For each *url* of *urls*:
  1. Let *urlRecord* be the result of [encoding-parsing a URL](#)<sup>p97</sup> given *url*, relative to *settings object*.
  2. If *urlRecord* is failure, then throw a ["SyntaxError" DOMException](#).
  3. [Append](#) *urlRecord* to *urlRecords*.
6. For each *urlRecord* of *urlRecords*:
  1. [Fetch a classic worker-imported script](#)<sup>p1088</sup> given *urlRecord* and *settings object*, passing along *performFetch* if provided. If this succeeds, let *script* be the result. Otherwise, rethrow the exception.
  2. [Run the classic script](#)<sup>p1096</sup> *script*, with the rethrow errors argument set to true.

#### Note

*script will run until it either returns, fails to parse, fails to catch an exception, or gets [prematurely aborted](#)<sup>p1097</sup> by the [terminate a worker](#)<sup>p1234</sup> algorithm defined above.*

If an exception was thrown or if the script was [prematurely aborted](#)<sup>p1097</sup>, then abort all these steps, letting the exception or aborting continue to be processed by the calling [script](#)<sup>p1084</sup>.

#### Note

*Service Workers is an example of a specification that runs this algorithm with its own [perform the fetch hook](#)<sup>p1087</sup>. [SW]<sup>p1482</sup>*

### 10.3.2 The [WorkerNavigator](#)<sup>p1240</sup> interface §<sup>p12</sup> 40

The **navigator** attribute of the [WorkerGlobalScope](#)<sup>p1228</sup> interface must return an instance of the [WorkerNavigator](#)<sup>p1240</sup> interface, which represents the identity and state of the user agent (the client):

```
IDL [Exposed=Worker]
interface WorkerNavigator {};
WorkerNavigator includes NavigatorID;
WorkerNavigator includes NavigatorLanguage;
WorkerNavigator includes NavigatorOnLine;
WorkerNavigator includes NavigatorConcurrentHardware;
```

### 10.3.3 The [WorkerLocation](#)<sup>p1240</sup> interface §<sup>p12</sup> 40

```
IDL [Exposed=Worker]
interface WorkerLocation {
  stringifier readonly attribute USVString href;
  readonly attribute USVString origin;
  readonly attribute USVString protocol;
  readonly attribute USVString host;
  readonly attribute USVString hostname;
  readonly attribute USVString port;
  readonly attribute USVString pathname;
  readonly attribute USVString search;
  readonly attribute USVString hash;
};
```

A [WorkerLocation](#)<sup>p1240</sup> object has an associated **WorkerGlobalScope object** (a [WorkerGlobalScope](#)<sup>p1228</sup> object).

The **href** getter steps are to return [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>](#), [serialized](#).

The **origin** getter steps are to return the [serialization<sup>p898</sup>](#) of [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s origin](#).

The **protocol** getter steps are to return [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s scheme](#), followed by ":".

The **host** getter steps are:

1. Let *url* be [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>](#).
2. If *url*'s [host](#) is null, return the empty string.
3. If *url*'s [port](#) is null, return *url*'s [host](#), [serialized](#).
4. Return *url*'s [host](#), [serialized](#), followed by ":" and *url*'s [port](#), [serialized](#).

The **hostname** getter steps are:

1. Let *host* be [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s host](#).
2. If *host* is null, return the empty string.
3. Return *host*, [serialized](#).

The **port** getter steps are:

1. Let *port* be [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s port](#).
2. If *port* is null, return the empty string.
3. Return *port*, [serialized](#).

The **pathname** getter steps are to return the result of [URL path serializing this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>](#).

The **search** getter steps are:

1. Let *query* be [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s query](#).
2. If *query* is either null or the empty string, return the empty string.
3. Return "?", followed by *query*.

The **hash** getter steps are:

1. Let *fragment* be [this's WorkerGlobalScope object<sup>p1240</sup>'s url<sup>p1229</sup>'s fragment](#).
2. If *fragment* is either null or the empty string, return the empty string.
3. Return "#", followed by *fragment*.

## 11 Worklets § p12 42

### 11.1 Introduction § p12 42

*This section is non-normative.*

Worklets are a piece of specification infrastructure which can be used for running scripts independent of the main JavaScript execution environment, while not requiring any particular implementation model.

The worklet infrastructure specified here cannot be used directly by web developers. Instead, other specifications build upon it to create directly-usable worklet types, specialized for running in particular parts of the browser implementation pipeline.

#### 11.1.1 Motivations § p12 42

*This section is non-normative.*

Allowing extension points to rendering, or other sensitive parts of the implementation pipeline such as audio output, is difficult. If extension points were done with full access to the APIs available on [Window](#)<sup>p922</sup>, engines would need to abandon previously-held assumptions for what could happen in the middle of those phases. For example, during the layout phase, rendering engines assume that no DOM will be modified.

Additionally, defining extension points in the [Window](#)<sup>p922</sup> environment would restrict user agents to performing work in the same thread as the [Window](#)<sup>p922</sup> object. (Unless implementations added complex, high-overhead infrastructure to allow thread-safe APIs, as well as thread-joining guarantees.)

Worklets are designed to allow extension points, while keeping guarantees that user agents currently rely on. This is done through new global environments, based on subclasses of [WorkletGlobalScope](#)<sup>p1245</sup>.

Worklets are similar to web workers. However, they:

- Are thread-agnostic. That is, they are not designed to run on a dedicated separate thread, like each worker is. Implementations can run worklets wherever they choose (including on the main thread).
- Are able to have multiple duplicate instances of the global scope created, for the purpose of parallelism.
- Do not use an event-based API. Instead, classes are registered on the global scope, whose methods are invoked by the user agent.
- Have a reduced API surface on the global scope.
- Have a lifetime for their [global object](#)<sup>p1076</sup> which is defined by other specifications, often in an [implementation-defined](#) manner.

As worklets have relatively high overhead, they are best used sparingly. Due to this, a given [WorkletGlobalScope](#)<sup>p1245</sup> is expected to be shared between multiple separate scripts. (This is similar to how a single [Window](#)<sup>p922</sup> is shared between multiple separate scripts.)

Worklets are a general technology that serve different use cases. Some worklets, such as those defined in *CSS Painting API*, provide extension points intended for stateless, idempotent, and short-running computations, which have special considerations as described in the next couple of sections. Others, such as those defined in *Web Audio API*, are used for stateful, long-running operations. [\[CSSPAINT\]](#)<sup>p1477</sup> [\[WEBAUDIO\]](#)<sup>p1483</sup>

#### 11.1.2 Code idempotence § p12 42

Some specifications which use worklets are intended to allow user agents to parallelize work over multiple threads, or to move work between threads as required. In these specifications, user agents might invoke methods on a web-developer-provided class in an [implementation-defined](#) order.

As a result of this, to prevent interoperability issues, authors who register classes on such [WorkletGlobalScope](#)<sup>p1245</sup>s should make their

code idempotent. That is, a method or set of methods on the class should produce the same output given a particular input.

This specification uses the following techniques in order to encourage authors to write code in an idempotent way:

- No reference to the global object is available (i.e., there is no counterpart to `self`<sup>p1229</sup> on `WorkletGlobalScope`<sup>p1245</sup>).

Although this was the intention when worklets were first specified, the introduction of `globalThis` has made it no longer true. See [issue #6059](#) for more discussion.

- Code is loaded as a [module script](#)<sup>p1085</sup>, which results in the code being executed in strict mode and with no shared `this` referencing the global proxy.

Together, these restrictions help prevent two different scripts from sharing state using properties of the [global object](#)<sup>p1076</sup>.

Additionally, specifications which use worklets and intend to allow [implementation-defined](#) behavior must obey the following:

- They must require user agents to always have at least two `WorkletGlobalScope`<sup>p1245</sup> instances per `Worklet`<sup>p1248</sup>, and randomly assign a method or set of methods on a class to a particular `WorkletGlobalScope`<sup>p1245</sup> instance. These specifications may provide an opt-out under memory constraints.
- These specifications must allow user agents to create and destroy instances of their `WorkletGlobalScope`<sup>p1245</sup> subclasses at any time.

### 11.1.3 Speculative evaluation <sup>p12</sup><sub>43</sub>

Some specifications which use worklets can invoke methods on a web-developer-provided class based on the state of the user agent. To increase concurrency between threads, a user agent may invoke a method speculatively, based on potential future states.

In these specifications, user agents might invoke such methods at any time, and with any arguments, not just ones corresponding to the current state of the user agent. The results of such speculative evaluations are not displayed immediately, but can be cached for use if the user agent state matches the speculated state. This can increase the concurrency between the user agent and worklet threads.

As a result of this, to prevent interoperability risks between user agents, authors who register classes on such `WorkletGlobalScope`<sup>p1245</sup>s should make their code stateless. That is, the only effect of invoking a method should be its result, and not any side effects such as updating mutable state.

The same techniques which encourage [code idempotence](#)<sup>p1242</sup> also encourage authors to write stateless code.

## 11.2 Examples <sup>p12</sup><sub>43</sub>

*This section is non-normative.*

For these examples, we'll use a fake worklet. The `Window`<sup>p922</sup> object provides two `Worklet`<sup>p1248</sup> instances, which each run code in their own collection of `FakeWorkletGlobalScope`<sup>p1244</sup>s:

```
IDL partial interface Window {
  [SameObject, SecureContext] readonly attribute Worklet fakeWorklet1;
  [SameObject, SecureContext] readonly attribute Worklet fakeWorklet2;
};
```

Each `Window`<sup>p922</sup> has two `Worklet`<sup>p1248</sup> instances, **fake worklet 1** and **fake worklet 2**. Both of these have their [worklet global scope type](#)<sup>p1248</sup> set to `FakeWorkletGlobalScope`<sup>p1244</sup>, and their [worklet destination type](#)<sup>p1248</sup> set to "fakeworklet". User agents should create at least two `FakeWorkletGlobalScope`<sup>p1244</sup> instances per worklet.

#### Note

"fakeworklet" is not actually a valid [destination](#) per Fetch. But this illustrates how real worklets would generally have their own worklet-type-specific destination. [\[FETCH\]](#)<sup>p1478</sup>

The `fakeWorklet1` getter steps are to return [this's `fake worklet 1`](#)<sup>p1243</sup>.

The `fakeWorklet2` getter steps are to return [this's `fake worklet 2`](#)<sup>p1243</sup>.

```
IDL
[Global=(Worklet,FakeWorklet),
 Exposed=FakeWorklet,
 SecureContext]
interface FakeWorkletGlobalScope : WorkletGlobalScope {
  undefined registerFake(DOMString type, Function classConstructor);
};
```

Each [FakeWorkletGlobalScope](#)<sup>p1244</sup> has a **registered class constructors map**, which is an [ordered map](#), initially empty.

The `registerFake(type, classConstructor)` method steps are to set [this's `registered class constructors map`](#)<sup>p1244</sup>[type] to `classConstructor`.

### 11.2.1 Loading scripts <sup>§p12</sup><sub>44</sub>

*This section is non-normative.*

To load scripts into [fake worklet 1](#)<sup>p1243</sup>, a web developer would write:

```
window.fakeWorklet1.addModule('script1.mjs');
window.fakeWorklet1.addModule('script2.mjs');
```

Note that which script finishes fetching and runs first is dependent on network timing: it could be either `script1.mjs` or `script2.mjs`. This generally won't matter for well-written scripts intended to be loaded in worklets, if they follow the suggestions about preparing for [speculative evaluation](#)<sup>p1243</sup>.

If a web developer wants to perform a task only after the scripts have successfully run and loaded into some worklets, they could write:

```
Promise.all([
  window.fakeWorklet1.addModule('script1.mjs'),
  window.fakeWorklet2.addModule('script2.mjs')
]).then(() => {
  // Do something which relies on those scripts being loaded.
});
```

Another important point about script-loading is that loaded scripts can be run in multiple [WorkletGlobalScope](#)<sup>p1245</sup>s per [Worklet](#)<sup>p1248</sup>, as discussed in the section on [code idempotence](#)<sup>p1242</sup>. In particular, the specification above for [fake worklet 1](#)<sup>p1243</sup> and [fake worklet 2](#)<sup>p1243</sup> require this. So, consider a scenario such as the following:

```
// script.mjs
console.log("Hello from a FakeWorkletGlobalScope!");
```

```
// app.mjs
window.fakeWorklet1.addModule("script.mjs");
```

This could result in output such as the following from a user agent's console:

```
[fakeWorklet1#1] Hello from a FakeWorkletGlobalScope!
[fakeWorklet1#4] Hello from a FakeWorkletGlobalScope!
[fakeWorklet1#2] Hello from a FakeWorkletGlobalScope!
[fakeWorklet1#3] Hello from a FakeWorkletGlobalScope!
```

If the user agent at some point decided to kill and restart the third instance of [FakeWorkletGlobalScope](#)<sup>p1244</sup>, the console would again print [fakeWorklet1#3] Hello from a FakeWorkletGlobalScope! when this occurs.

## 11.2.2 Registering a class and invoking its methods § p12 45

*This section is non-normative.*

Let's say that one of the intended usages of our fake worklet by web developers is to allow them to customize the highly-complex process of boolean negation. They might register their customization as follows:

```
// script.mjs
registerFake('negation-processor', class {
  process(arg) {
    return !arg;
  }
});
```

```
// app.mjs
window.fakeWorklet1.addModule("script.mjs");
```

To make use of such registered classes, the specification for fake worklets could define a **find the opposite of true** algorithm, given a [Worklet](#)<sup>p1248</sup> *worklet*:

1. Optionally, [create a worklet global scope](#)<sup>p1246</sup> for *worklet*.
2. Let *workletGlobalScope* be one of *worklet*'s [global scopes](#)<sup>p1248</sup>, chosen in an [implementation-defined](#) manner.
3. Let *classConstructor* be *workletGlobalScope*'s [registered class constructors map](#)<sup>p1244</sup>["negation-processor"].
4. Let *classInstance* be the result of [constructing](#) *classConstructor*, with no arguments.
5. Let *function* be [Get](#)(*classInstance*, "process"). Rethrow any exceptions.
6. Let *callback* be the result of [converting](#) *function* to a Web IDL [Function](#) instance.
7. Return the result of [invoking](#) *callback* with « true » and "rethrow", and with [callback this value](#) set to *classInstance*.

### Note

*Another, perhaps better, specification architecture would be to extract the "process" property and convert it into a [Function](#) at registration time, as part of the [registerFake\(\)](#)<sup>p1244</sup> method steps.*

## 11.3 Infrastructure § p12 45

### 11.3.1 The global scope § p12 45

Subclasses of [WorkletGlobalScope](#)<sup>p1245</sup> are used to create [global objects](#)<sup>p1076</sup> wherein code loaded into a particular [Worklet](#)<sup>p1248</sup> can execute.

```
IDL [Exposed=Worklet, SecureContext]
interface WorkletGlobalScope {};
```

### Note

*Other specifications are intended to subclass [WorkletGlobalScope](#)<sup>p1245</sup>, adding APIs to register a class, as well as other APIs specific for their worklet type.*

Each [WorkletGlobalScope](#)<sup>p1245</sup> has an associated **module map**. It is a [module map](#)<sup>p1119</sup>, initially empty.

### 11.3.1.1 Agents and event loops <sup>§ p12 46</sup>

*This section is non-normative.*

Each [WorkletGlobalScope](#)<sup>p1245</sup> is contained in its own [worklet agent](#)<sup>p1072</sup>, which has its corresponding [event loop](#)<sup>p1123</sup>. However, in practice, implementation of these agents and event loops is expected to be different from most others.

A [worklet agent](#)<sup>p1072</sup> exists for each [WorkletGlobalScope](#)<sup>p1245</sup> since, in theory, an implementation could use a separate thread for each [WorkletGlobalScope](#)<sup>p1245</sup> instance, and allowing this level of parallelism is best done using agents. However, because their `[[CanBlock]]` value is false, there is no requirement that agents and threads are one-to-one. This allows implementations the freedom to execute scripts loaded into a worklet on any thread, including one running code from other agents with `[[CanBlock]]` of false, such as the thread of a [similar-origin window agent](#)<sup>p1072</sup> ("the main thread"). Contrast this with [dedicated worker agents](#)<sup>p1072</sup>, whose true value for `[[CanBlock]]` effectively requires them to get a dedicated operating system thread.

Worklet [event loops](#)<sup>p1123</sup> are also somewhat special. They are only used for [tasks](#)<sup>p1124</sup> associated with [addModule\(\)](#)<sup>p1249</sup>, tasks wherein the user agent invokes author-defined methods, and [microtasks](#)<sup>p1124</sup>. Thus, even though the [event loop processing model](#)<sup>p1126</sup> specifies that all event loops run continuously, implementations can achieve observably-equivalent results using a simpler strategy, which just [invokes](#) author-provided methods and then relies on that process to [perform a microtask checkpoint](#)<sup>p1131</sup>.

### 11.3.1.2 Creation and termination <sup>§ p12 46</sup>

To **create a worklet global scope** for a [Worklet](#)<sup>p1248</sup> *worklet*:

1. Let *outsideSettings* be *worklet*'s [relevant settings object](#)<sup>p1083</sup>.
2. Let *agent* be the result of [obtaining a worklet agent](#)<sup>p1074</sup> given *outsideSettings*. Run the rest of these steps in that agent.
3. Let *realmExecutionContext* be the result of [creating a new realm](#)<sup>p1077</sup> given *agent* and the following customizations:
  - For the global object, create a new object of the type given by *worklet*'s [worklet global scope type](#)<sup>p1248</sup>.
4. Let *workletGlobalScope* be the [global object](#)<sup>p1077</sup> of *realmExecutionContext*'s Realm component.
5. Let *insideSettings* be the result of [setting up a worklet environment settings object](#)<sup>p1247</sup> given *realmExecutionContext* and *outsideSettings*.
6. Let *pendingAddedModules* be a [clone](#) of *worklet*'s [added modules list](#)<sup>p1248</sup>.
7. Let *runNextAddedModule* be the following steps:
  1. If *pendingAddedModules* **is not empty**, then:
    1. Let *moduleURL* be the result of [dequeueing](#) from *pendingAddedModules*.
    2. [Fetch a worklet script graph](#)<sup>p1090</sup> given *moduleURL*, *insideSettings*, *worklet*'s [worklet destination type](#)<sup>p1248</sup>, **what credentials mode?**, *insideSettings*, *worklet*'s [module responses map](#)<sup>p1248</sup>, and with the following steps given *script*:

#### Note

*This will not actually perform a network request, as it will just reuse [responses](#) from *worklet*'s [module responses map](#)<sup>p1248</sup>. The main purpose of this step is to create a new *workletGlobalScope*-specific [module script](#)<sup>p1085</sup> from the [response](#).*

1. **Assert**: *script* is not null, since the fetch succeeded and the source text was successfully parsed when *worklet*'s [module responses map](#)<sup>p1248</sup> was initially populated with *moduleURL*.
2. [Run a module script](#)<sup>p1096</sup> given *script*.
3. Run *runNextAddedModule*.
3. Abort these steps.
2. **Append** *workletGlobalScope* to *outsideSettings*'s [global object](#)<sup>p1077</sup>'s [associated Document](#)<sup>p923</sup>'s [worklet global scopes](#)<sup>p1250</sup>.
3. **Append** *workletGlobalScope* to *worklet*'s [global scopes](#)<sup>p1248</sup>.

4. Run the [responsible event loop](#)<sup>p1076</sup> specified by *insideSettings*.

8. Run *runNextAddedModule*.

To **terminate a worklet global scope** given a [WorkletGlobalScope](#)<sup>p1245</sup> *workletGlobalScope*:

1. Let *eventLoop* be *workletGlobalScope*'s [relevant agent](#)<sup>p1073</sup>'s [event loop](#)<sup>p1123</sup>.
2. If there are any [tasks](#)<sup>p1124</sup> queued in *eventLoop*'s [task queues](#)<sup>p1123</sup>, discard them without processing them.
3. Wait for *eventLoop* to complete the [currently running task](#)<sup>p1124</sup>.
4. If the previous step doesn't complete within an [implementation-defined](#) period of time, then [abort the script](#)<sup>p1097</sup> currently running in the worklet.
5. Destroy *eventLoop*.
6. [Remove](#) *workletGlobalScope* from the [global scopes](#)<sup>p1248</sup> of the [Worklet](#)<sup>p1248</sup> whose [global scopes](#)<sup>p1248</sup> contains *workletGlobalScope*.
7. [Remove](#) *workletGlobalScope* from the [worklet global scopes](#)<sup>p1250</sup> of the [Document](#)<sup>p130</sup> whose [worklet global scopes](#)<sup>p1250</sup> contains *workletGlobalScope*.

### 11.3.1.3 Script settings for worklets §<sup>p12</sup> 47

To **set up a worklet environment settings object**, given a [JavaScript execution context](#) *executionContext* and an [environment settings object](#)<sup>p1076</sup> *outsideSettings*:

1. Let *origin* be a unique [opaque origin](#)<sup>p898</sup>.
2. Let *inheritedAPIBaseURL* be *outsideSettings*'s [API base URL](#)<sup>p1076</sup>.
3. Let *inheritedPolicyContainer* be a [clone](#)<sup>p917</sup> of *outsideSettings*'s [policy container](#)<sup>p1076</sup>.
4. Let *realm* be the value of *executionContext*'s Realm component.
5. Let *workletGlobalScope* be *realm*'s [global object](#)<sup>p1077</sup>.
6. Let *settingsObject* be a new [environment settings object](#)<sup>p1076</sup> whose algorithms are defined as follows:

**The [realm execution context](#)**<sup>p1076</sup>

Return *executionContext*.

**The [module map](#)**<sup>p1076</sup>

Return *workletGlobalScope*'s [module map](#)<sup>p1245</sup>.

**The [API base URL](#)**<sup>p1076</sup>

Return *inheritedAPIBaseURL*.

**Note**

Unlike workers or other globals derived from a single resource, worklets have no primary resource; instead, multiple scripts, each with their own URL, are loaded into the global scope via [worklet.addModule\(\)](#)<sup>p1249</sup>. So this [API base URL](#)<sup>p1076</sup> is rather unlike that of other globals. However, so far this doesn't matter, as no APIs available to worklet code make use of the [API base URL](#)<sup>p1076</sup>.

**The [origin](#)**<sup>p1076</sup>

Return *origin*.

**The [policy container](#)**<sup>p1076</sup>

Return *inheritedPolicyContainer*.

**The [cross-origin isolated capability](#)**<sup>p1076</sup>

Return TODO.

## The [time origin](#)<sup>p1076</sup>

**Assert:** this algorithm is never called, because the [time origin](#)<sup>p1076</sup> is not available in a worklet context.

7. Set *settingsObject*'s [id](#)<sup>p1075</sup> to a new unique opaque string, [creation URL](#)<sup>p1075</sup> to *inheritedAPIBaseURL*, [top-level creation URL](#)<sup>p1075</sup> to null, [top-level origin](#)<sup>p1076</sup> to *outsideSettings*'s [top-level origin](#)<sup>p1076</sup>, [target browsing context](#)<sup>p1076</sup> to null, and [active service worker](#)<sup>p1076</sup> to null.
8. Set *realm*'s `[[HostDefined]]` field to *settingsObject*.
9. Return *settingsObject*.

### 11.3.2 The [Worklet](#)<sup>p1248</sup> class §<sup>p12</sup><sub>48</sub>

The [Worklet](#)<sup>p1248</sup> class provides the capability to add module scripts into its associated [WorkletGlobalScope](#)<sup>p1245</sup>s. The user agent can then create classes registered on the [WorkletGlobalScope](#)<sup>p1245</sup>s and invoke their methods.

**IDL**

```
[Exposed=Window, SecureContext]
interface Worklet {
  [NewObject] Promise<undefined> addModule(USVString moduleURL, optional WorkletOptions options = {});
};

dictionary WorkletOptions {
  RequestCredentials credentials = "same-origin";
};
```

Specifications that create [Worklet](#)<sup>p1248</sup> instances must specify the following for a given instance:

- its **worklet global scope type**, which must be a Web IDL type that [inherits](#) from [WorkletGlobalScope](#)<sup>p1245</sup>; and
- its **worklet destination type**, which must be a [destination](#), and is used when fetching scripts.

#### For web developers (non-normative)

**`await worklet.addModule`**<sup>p1249</sup>(*moduleURL*[, { [credentials](#)<sup>p1248</sup> }])

Loads and executes the [module script](#)<sup>p1085</sup> given by *moduleURL* into all of *worklet*'s [global scopes](#)<sup>p1248</sup>. It can also create additional global scopes as part of this process, depending on the worklet type. The returned promise will fulfill once the script has been successfully loaded and run in all global scopes.

The [credentials](#)<sup>p1248</sup> option can be set to a [credentials mode](#) to modify the script-fetching process. It defaults to "same-origin".

Any failures in [fetching](#)<sup>p1090</sup> the script or its dependencies will cause the returned promise to be rejected with an ["AbortError" DOMException](#). Any errors in parsing the script or its dependencies will cause the returned promise to be rejected with the exception generated during parsing.

A [Worklet](#)<sup>p1248</sup> has a [list](#) of **global scopes**, which contains instances of the [Worklet](#)<sup>p1248</sup>'s [worklet global scope type](#)<sup>p1248</sup>. It is initially empty.

A [Worklet](#)<sup>p1248</sup> has an **added modules list**, which is a [list](#) of [URLs](#), initially empty. Access to this list should be thread-safe.

A [Worklet](#)<sup>p1248</sup> has a **module responses map**, which is an [ordered map](#) from [URLs](#) to either "fetching" or [tuples](#) consisting of a [response](#) and either null, failure, or a [byte sequence](#) representing the response body. This map is initially empty, and access to it should be thread-safe.

#### Note

The [added modules list](#)<sup>p1248</sup> and [module responses map](#)<sup>p1248</sup> exist to ensure that [WorkletGlobalScope](#)<sup>p1245</sup>s created at different times get equivalent [module scripts](#)<sup>p1085</sup> run in them, based on the same source text. This allows the creation of additional [WorkletGlobalScope](#)<sup>p1245</sup>s to be transparent to the author.

In practice, user agents are not expected to implement these data structures, and the algorithms that consult them, using thread-safe programming techniques. Instead, when [addModule\(\)](#)<sup>p1249</sup> is called, user agents can fetch the module graph on the main

thread, and send the fetched source text (i.e., the important data contained in the [module responses map](#)<sup>p1248</sup>) to each thread which has a [WorkletGlobalScope](#)<sup>p1245</sup>.

Then, when a user agent [creates](#)<sup>p1246</sup> a new [WorkletGlobalScope](#)<sup>p1245</sup> for a given [Worklet](#)<sup>p1248</sup>, it can simply send the map of fetched source text and the list of entry points from the main thread to the thread containing the new [WorkletGlobalScope](#)<sup>p1245</sup>.

The [addModule\(moduleURL, options\)](#) method steps are:

1. Let *outsideSettings* be the [relevant settings object](#)<sup>p1083</sup> of [this](#).
2. Let *moduleURLRecord* be the result of [encoding-parsing a URL](#)<sup>p97</sup> given *moduleURL*, relative to *outsideSettings*.
3. If *moduleURLRecord* is failure, then return [a promise rejected with](#) a ["SyntaxError" DOMException](#).
4. Let *promise* be a new promise.
5. Run the following steps [in parallel](#)<sup>p43</sup>:
  1. If [this's global scopes](#)<sup>p1248</sup> is empty, then:
    1. [Create a worklet global scope](#)<sup>p1246</sup> given [this](#).
    2. Optionally, [create](#)<sup>p1246</sup> additional global scope instances given [this](#), depending on the specific worklet in question and its specification.
    3. Wait for all steps of the [creation](#)<sup>p1246</sup> process(es) — including those taking place within the [worklet agents](#)<sup>p1072</sup> — to complete, before moving on.
  2. Let *pendingTasks* be [this's global scopes](#)<sup>p1248</sup>'s [size](#).
  3. Let *addedSuccessfully* be false.
  4. [For each](#) *workletGlobalScope* of [this's global scopes](#)<sup>p1248</sup>, [queue a global task](#)<sup>p1125</sup> on the [networking task source](#)<sup>p1134</sup> given *workletGlobalScope* to [fetch a worklet script graph](#)<sup>p1090</sup> given *moduleURLRecord*, *outsideSettings*, [this's worklet destination type](#)<sup>p1248</sup>, [options\["credentials"\]](#)<sup>p1248</sup>, *workletGlobalScope's relevant settings object*<sup>p1083</sup>, [this's module responses map](#)<sup>p1248</sup>, and the following steps given *script*:

#### Note

Only the first of these fetches will actually perform a network request; the ones for other [WorkletGlobalScope](#)<sup>p1245</sup>s will reuse [responses](#) from [this's module responses map](#)<sup>p1248</sup>.

1. If *script* is null, then:
  1. [Queue a global task](#)<sup>p1125</sup> on the [networking task source](#)<sup>p1134</sup> given [this's relevant global object](#)<sup>p1083</sup> to perform the following steps:
    1. If *pendingTasks* is not −1, then:
      1. Set *pendingTasks* to −1.
      2. Reject *promise* with an ["AbortError" DOMException](#).
    2. Abort these steps.
  2. If *script's error to rethrow*<sup>p1084</sup> is not null, then:
    1. [Queue a global task](#)<sup>p1125</sup> on the [networking task source](#)<sup>p1134</sup> given [this's relevant global object](#)<sup>p1083</sup> to perform the following steps:
      1. If *pendingTasks* is not −1, then:
        1. Set *pendingTasks* to −1.
        2. Reject *promise* with *script's error to rethrow*<sup>p1084</sup>.
      2. Abort these steps.

3. If *addedSuccessfully* is false, then:
  1. [Append](#) *moduleURLRecord* to [this's added modules list](#)<sup>p1248</sup>.
  2. Set *addedSuccessfully* to true.
4. [Run a module script](#)<sup>p1096</sup> given *script*.
5. [Queue a global task](#)<sup>p1125</sup> on the [networking task source](#)<sup>p1134</sup> given [this's relevant global object](#)<sup>p1083</sup> to perform the following steps:
  1. If *pendingTasks* is not  $-1$ , then:
    1. Set *pendingTasks* to *pendingTasks*  $- 1$ .
    2. If *pendingTasks* is 0, then resolve *promise*.
6. Return *promise*.

### 11.3.3 The worklet's lifetime §<sup>p12</sup> 50

The lifetime of a [Worklet](#)<sup>p1248</sup> has no special considerations; it is tied to the object it belongs to, such as the [Window](#)<sup>p922</sup>.

Each [Document](#)<sup>p130</sup> has a **worklet global scopes**, which is a [set](#) of [WorkletGlobalScope](#)<sup>p1245</sup>s, initially empty.

The lifetime of a [WorkletGlobalScope](#)<sup>p1245</sup> is, at a minimum, tied to the [Document](#)<sup>p130</sup> whose [worklet global scopes](#)<sup>p1250</sup> contain it. In particular, [destroying](#)<sup>p1066</sup> the [Document](#)<sup>p130</sup> will [terminate](#)<sup>p1247</sup> the corresponding [WorkletGlobalScope](#)<sup>p1245</sup> and allow it to be garbage-collected.

Additionally, user agents may, at any time, [terminate](#)<sup>p1247</sup> a given [WorkletGlobalScope](#)<sup>p1245</sup>, unless the specification defining the corresponding worklet type says otherwise. For example, they might terminate them if the [worklet agent](#)<sup>p1072</sup>'s [event loop](#)<sup>p1123</sup> has no [tasks](#)<sup>p1124</sup> queued, or if the user agent has no pending operations planning to make use of the worklet, or if the user agent detects abnormal operations such as infinite loops or callbacks exceeding imposed time limits.

Finally, specifications for specific worklet types can give more specific details on when to [create](#)<sup>p1246</sup> [WorkletGlobalScope](#)<sup>p1245</sup>s for a given worklet type. For example, they might create them during specific processes that call upon worklet code, as in the [example](#)<sup>p1245</sup>.

## 12 Web storage §<sup>p12</sup> 51

### 12.1 Introduction §<sup>p12</sup> 51

*This section is non-normative.*

This specification introduces two related mechanisms, similar to HTTP session cookies, for storing name-value pairs on the client side. [\[COOKIES\]](#)<sup>p1476</sup>

The first is designed for scenarios where the user is carrying out a single transaction, but could be carrying out multiple transactions in different windows at the same time.

Cookies don't really handle this case well. For example, a user could be buying plane tickets in two different windows, using the same site. If the site used cookies to keep track of which ticket the user was buying, then as the user clicked from page to page in both windows, the ticket currently being purchased would "leak" from one window to the other, potentially causing the user to buy two tickets for the same flight without noticing.

To address this, this specification introduces the [sessionStorage](#)<sup>p1254</sup> getter. Sites can add data to the session storage, and it will be accessible to any page from the same site opened in that window.

#### Example

For example, a page could have a checkbox that the user ticks to indicate that they want insurance:

```
<label>
  <input type="checkbox" onchange="sessionStorage.insurance = checked ? 'true' : ''">
  I want insurance on this trip.
</label>
```

A later page could then check, from script, whether the user had checked the checkbox or not:

```
if (sessionStorage.insurance) { ... }
```

If the user had multiple windows opened on the site, each one would have its own individual copy of the session storage object.

The second storage mechanism is designed for storage that spans multiple windows, and lasts beyond the current session. In particular, web applications might wish to store megabytes of user data, such as entire user-authored documents or a user's mailbox, on the client side for performance reasons.

Again, cookies do not handle this case well, because they are transmitted with every request.

The [localStorage](#)<sup>p1255</sup> getter is used to access a page's local storage area.

#### Example

The site at example.com can display a count of how many times the user has loaded its page by putting the following at the bottom of its page:

```
<p>
  You have viewed this page
  <span id="count">an untold number of</span>
  time(s).
</p>
<script>
  if (!localStorage.pageLoadCount)
    localStorage.pageLoadCount = 0;
```

```
localStorage.pageLoadCount = parseInt(localStorage.pageLoadCount) + 1;
document.getElementById('count').textContent = localStorage.pageLoadCount;
</script>
```

Each site has its own separate storage area.

### ⚠Warning!

**The `localStorage` <sup>p1255</sup> getter provides access to shared state. This specification does not define the interaction with other agent clusters in a multiprocess user agent, and authors are encouraged to assume that there is no locking mechanism. A site could, for instance, try to read the value of a key, increment its value, then write it back out, using the new value as a unique identifier for the session; if the site does this twice in two different browser windows at the same time, it might end up using the same "unique" identifier for both sessions, with potentially disastrous effects.**

## 12.2 The API <sup>p12</sup> <sub>52</sub>

### 12.2.1 The `Storage` <sup>p1252</sup> interface <sup>p12</sup> <sub>52</sub>

```
IDL [Exposed=Window]
interface Storage {
  readonly attribute unsigned long length;
  DOMString? key(unsigned long index);
  getter DOMString? getItem(DOMString key);
  setter undefined setItem(DOMString key, DOMString value);
  deleter undefined removeItem(DOMString key);
  undefined clear();
};
```

#### For web developers (non-normative)

##### `storage.length` <sup>p1253</sup>

Returns the number of key/value pairs.

##### `storage.key` <sup>p1253</sup> (*n*)

Returns the name of the *n*th key, or null if *n* is greater than or equal to the number of key/value pairs.

##### `value = storage.getItem` <sup>p1253</sup> (*key*)

##### `value = storage[key]`

Returns the current value associated with the given *key*, or null if the given *key* does not exist.

##### `storage.setItem` <sup>p1253</sup> (*key*, *value*)

##### `storage[key] = value`

Sets the value of the pair identified by *key* to *value*, creating a new key/value pair if none existed for *key* previously.

Throws a "`QuotaExceededError`" `DOMException` exception if the new value couldn't be set. (Setting could fail if, e.g., the user has disabled storage for the site, or if the quota has been exceeded.)

Dispatches a `storage` <sup>p1472</sup> event on `Window` <sup>p922</sup> objects holding an equivalent `Storage` <sup>p1252</sup> object.

##### `storage.removeItem` <sup>p1254</sup> (*key*)

##### `delete storage[key]`

Removes the key/value pair with the given *key*, if a key/value pair with the given *key* exists.

Dispatches a `storage` <sup>p1472</sup> event on `Window` <sup>p922</sup> objects holding an equivalent `Storage` <sup>p1252</sup> object.

**storage.clear**<sup>p1254</sup>()

Removes all key/value pairs, if there are any.

Dispatches a **storage**<sup>p1472</sup> event on **Window**<sup>p922</sup> objects holding an equivalent **Storage**<sup>p1252</sup> object.

A **Storage**<sup>p1252</sup> object has an associated:

**map**

A **storage proxy map**.

**type**

"local" or "session".

To **reorder** a **Storage**<sup>p1252</sup> object *storage*, reorder *storage*'s **map**<sup>p1253</sup>'s **entries** in an **implementation-defined** manner.

**Note**

*Unfortunate as it is, iteration order is not defined and can change upon most mutations.*

To **broadcast** a **Storage**<sup>p1252</sup> object *storage*, given a *key*, *oldValue*, and *newValue*, run these steps:

1. Let *thisDocument* be *storage*'s **relevant global object**<sup>p1083</sup>'s **associated Document**<sup>p923</sup>.
2. Let *url* be *thisDocument*'s **URL**.
3. Let *remoteStorages* be all **Storage**<sup>p1252</sup> objects excluding *storage* whose:
  - **type**<sup>p1253</sup> is *storage*'s **type**<sup>p1253</sup>
  - **relevant settings object**<sup>p1083</sup>'s **origin**<sup>p898</sup> is **same origin**<sup>p899</sup> with *storage*'s **relevant settings object**<sup>p1083</sup>'s **origin**<sup>p898</sup>.

and, if **type**<sup>p1253</sup> is "session", whose **relevant settings object**<sup>p1083</sup>'s **associated Document**<sup>p923</sup>'s **node navigable**<sup>p989</sup>'s **traversable navigable**<sup>p990</sup> is *thisDocument*'s **node navigable**<sup>p989</sup>'s **traversable navigable**<sup>p990</sup>.

4. **For each** *remoteStorage* of *remoteStorages*: **queue a global task**<sup>p1125</sup> on the **DOM manipulation task source**<sup>p1134</sup> given *remoteStorage*'s **relevant global object**<sup>p1083</sup> to **fire an event** named **storage**<sup>p1472</sup> at *remoteStorage*'s **relevant global object**<sup>p1083</sup>, using **StorageEvent**<sup>p1255</sup>, with **key**<sup>p1256</sup> initialized to *key*, **oldValue**<sup>p1256</sup> initialized to *oldValue*, **newValue**<sup>p1256</sup> initialized to *newValue*, **url**<sup>p1256</sup> initialized to *url*, and **storageArea**<sup>p1256</sup> initialized to *remoteStorage*.

**Note**

*The **Document**<sup>p130</sup> object associated with the resulting **task**<sup>p1124</sup> is not necessarily **fully active**<sup>p1003</sup>, but events fired on such objects are ignored by the **event loop**<sup>p1123</sup> until the **Document**<sup>p130</sup> becomes **fully active**<sup>p1003</sup> again.*

The **length** getter steps are to return *this*'s **map**<sup>p1253</sup>'s **size**.

The **key(index)** method steps are:

1. If *index* is greater than or equal to *this*'s **map**<sup>p1253</sup>'s **size**, then return null.
2. Let *keys* be the result of running **get the keys** on *this*'s **map**<sup>p1253</sup>.
3. Return *keys*[*index*].

The **supported property names** on a **Storage**<sup>p1252</sup> object *storage* are the result of running **get the keys** on *storage*'s **map**<sup>p1253</sup>.

The **getItem(key)** method steps are:

1. If *this*'s **map**<sup>p1253</sup>[*key*] does not **exist**, then return null.
2. Return *this*'s **map**<sup>p1253</sup>[*key*].

The **setItem(key, value)** method are:

1. Let *oldValue* be null.

2. Let *reorder* be true.
3. If *this*'s *map*<sup>p1253</sup>[*key*] exists:
  1. Set *oldValue* to *this*'s *map*<sup>p1253</sup>[*key*].
  2. If *oldValue* is *value*, then return.
  3. Set *reorder* to false.
4. If *value* cannot be stored, then throw a "QuotaExceededError" *DOMException* exception.
5. Set *this*'s *map*<sup>p1253</sup>[*key*] to *value*.
6. If *reorder* is true, then *reorder*<sup>p1253</sup> *this*.
7. Broadcast<sup>p1253</sup> *this* with *key*, *oldValue*, and *value*.

The **removeItem(*key*)** method steps are:

1. If *this*'s *map*<sup>p1253</sup>[*key*] does not exist, then return null.
2. Set *oldValue* to *this*'s *map*<sup>p1253</sup>[*key*].
3. Remove *this*'s *map*<sup>p1253</sup>[*key*].
4. Reorder<sup>p1253</sup> *this*.
5. Broadcast<sup>p1253</sup> *this* with *key*, *oldValue*, and null.

The **clear()** method steps are:

1. Clear *this*'s *map*<sup>p1253</sup>.
2. Broadcast<sup>p1253</sup> *this* with null, null, and null.

### 12.2.2 The **sessionStorage**<sup>p1254</sup> getter § p1254

```
IDL
interface mixin WindowSessionStorage {
  readonly attribute Storage sessionStorage;
};
Window includes WindowSessionStorage;
```

For web developers (non-normative)

#### **window.sessionStorage**<sup>p1254</sup>

Returns the **Storage**<sup>p1252</sup> object associated with that *window*'s origin's session storage area.

Throws a "SecurityError" *DOMException* if the **Document**<sup>p130</sup>'s *origin* is an *opaque origin*<sup>p898</sup> or if the request violates a policy decision (e.g., if the user agent is configured to not allow the page to persist data).

A **Document**<sup>p130</sup> object has an associated **session storage holder**, which is null or a **Storage**<sup>p1252</sup> object. It is initially null.

The **sessionStorage** getter steps are:

1. If *this*'s *associated Document*<sup>p923</sup>'s *session storage holder*<sup>p1254</sup> is non-null, then return *this*'s *associated Document*<sup>p923</sup>'s *session storage holder*<sup>p1254</sup>.
2. Let *map* be the result of running *obtain a session storage bottle map* with *this*'s *relevant settings object*<sup>p1083</sup> and "sessionStorage".
3. If *map* is failure, then throw a "SecurityError" *DOMException*.
4. Let *storage* be a new **Storage**<sup>p1252</sup> object whose *map*<sup>p1253</sup> is *map*.
5. Set *this*'s *associated Document*<sup>p923</sup>'s *session storage holder*<sup>p1254</sup> to *storage*.

6. Return *storage*.

#### Note

After [creating a new auxiliary browsing context and document](#)<sup>p1000</sup>, the session storage [is copied](#)<sup>p991</sup> over.

### 12.2.3 The [localStorage](#)<sup>p1255</sup> getter § p1255

IDL

```
interface mixin WindowLocalStorage {  
  readonly attribute Storage localStorage;  
};  
Window includes WindowLocalStorage;
```

#### For web developers (non-normative)

##### [window.localStorage](#)<sup>p1255</sup>

Returns the [Storage](#)<sup>p1252</sup> object associated with *window*'s origin's local storage area.

Throws a ["SecurityError" DOMException](#) if the [Document](#)<sup>p130</sup>'s [origin](#) is an [opaque origin](#)<sup>p898</sup> or if the request violates a policy decision (e.g., if the user agent is configured to not allow the page to persist data).

A [Document](#)<sup>p130</sup> object has an associated **local storage holder**, which is null or a [Storage](#)<sup>p1252</sup> object. It is initially null.

The [localStorage](#) getter steps are:

1. If [this](#)'s [associated Document](#)<sup>p923</sup>'s [local storage holder](#)<sup>p1255</sup> is non-null, then return [this](#)'s [associated Document](#)<sup>p923</sup>'s [local storage holder](#)<sup>p1255</sup>.
2. Let *map* be the result of running [obtain a local storage bottle map](#) with [this](#)'s [relevant settings object](#)<sup>p1083</sup> and "localStorage".
3. If *map* is failure, then throw a ["SecurityError" DOMException](#).
4. Let *storage* be a new [Storage](#)<sup>p1252</sup> object whose [map](#)<sup>p1253</sup> is *map*.
5. Set [this](#)'s [associated Document](#)<sup>p923</sup>'s [local storage holder](#)<sup>p1255</sup> to *storage*.
6. Return *storage*.

### 12.2.4 The [StorageEvent](#)<sup>p1255</sup> interface § p1255

IDL

```
[Exposed=Window]  
interface StorageEvent : Event {  
  constructor(DOMString type, optional StorageEventInit eventInitDict = {});  
  
  readonly attribute DOMString? key;  
  readonly attribute DOMString? oldValue;  
  readonly attribute DOMString? newValue;  
  readonly attribute USVString url;  
  readonly attribute Storage? storageArea;  
  
  undefined initStorageEvent(DOMString type, optional boolean bubbles = false, optional boolean cancelable = false, optional DOMString? key = null, optional DOMString? oldValue = null, optional DOMString? newValue = null, optional USVString url = "", optional Storage? storageArea = null);  
};  
  
dictionary StorageEventInit : EventInit {  
  DOMString? key = null;  
  DOMString? oldValue = null;
```

```
DOMString? newValue = null;
USVString url = "";
Storage? storageArea = null;
};
```

For web developers (non-normative)

**event.key**<sup>p1256</sup>

Returns the key of the storage item being changed.

**event.oldValue**<sup>p1256</sup>

Returns the old value of the key of the storage item whose value is being changed.

**event.newValue**<sup>p1256</sup>

Returns the new value of the key of the storage item whose value is being changed.

**event.url**<sup>p1256</sup>

Returns the URL of the document whose storage item changed.

**event.storageArea**<sup>p1256</sup>

Returns the [Storage](#)<sup>p1252</sup> object that was affected.

The **key**, **oldValue**, **newValue**, **url**, and **storageArea** attributes must return the values they were initialized to.

The **initStorageEvent(type, bubbles, cancelable, key, oldValue, newValue, url, storageArea)** method must initialize the event in a manner analogous to the similarly-named **initEvent()** method. [\[DOM\]](#)<sup>p1478</sup>

## 12.3 Privacy <sup>p12</sup><sub>56</sub>

### 12.3.1 User tracking <sup>p12</sup><sub>56</sub>

A third-party advertiser (or any entity capable of getting content distributed to multiple sites) could use a unique identifier stored in its local storage area to track a user across multiple sessions, building a profile of the user's interests to allow for highly targeted advertising. In conjunction with a site that is aware of the user's real identity (for example an e-commerce site that requires authenticated credentials), this could allow oppressive groups to target individuals with greater accuracy than in a world with purely anonymous web usage.

There are a number of techniques that can be used to mitigate the risk of user tracking:

#### Blocking third-party storage

User agents may restrict access to the [localStorage](#)<sup>p1255</sup> objects to scripts originating at the domain of the [active document](#)<sup>p989</sup> of the [top-level traversable](#)<sup>p990</sup>, for instance denying access to the API for pages from other domains running in [iframe](#)<sup>p390</sup>s.

#### Expiring stored data

User agents may, possibly in a manner configured by the user, automatically delete stored data after a period of time.

For example, a user agent could be configured to treat third-party local storage areas as session-only storage, deleting the data once the user had closed all the [navigables](#)<sup>p989</sup> that could access it.

This can restrict the ability of a site to track a user, as the site would then only be able to track the user across multiple sessions when they authenticate with the site itself (e.g. by making a purchase or logging in to a service).

However, this also reduces the usefulness of the API as a long-term storage mechanism. It can also put the user's data at risk, if the user does not fully understand the implications of data expiration.

#### Treating persistent storage as cookies

If users attempt to protect their privacy by clearing cookies without also clearing data stored in the local storage area, sites can defeat those attempts by using the two features as redundant backup for each other. User agents should present the interfaces for clearing these in a way that helps users to understand this possibility and enables them to delete data in all persistent storage features simultaneously. [\[COOKIES\]](#)<sup>p1476</sup>

### Site-specific safelisting of access to local storage areas

User agents may allow sites to access session storage areas in an unrestricted manner, but require the user to authorize access to local storage areas.

### Origin-tracking of stored data

User agents may record the [origins](#)<sup>p898</sup> of sites that contained content from third-party origins that caused data to be stored.

If this information is then used to present the view of data currently in persistent storage, it would allow the user to make informed decisions about which parts of the persistent storage to prune. Combined with a blocklist ("delete this data and prevent this domain from ever storing data again"), the user can restrict the use of persistent storage to sites that they trust.

### Shared blocklists

User agents may allow users to share their persistent storage domain blocklists.

This would allow communities to act together to protect their privacy.

While these suggestions prevent trivial use of this API for user tracking, they do not block it altogether. Within a single domain, a site can continue to track the user during a session, and can then pass all this information to the third party along with any identifying information (names, credit card numbers, addresses) obtained by the site. If a third party cooperates with multiple sites to obtain such information, a profile can still be created.

However, user tracking is to some extent possible even with no cooperation from the user agent whatsoever, for instance by using session identifiers in URLs, a technique already commonly used for innocuous purposes but easily repurposed for user tracking (even retroactively). This information can then be shared with other sites, using visitors' IP addresses and other user-specific data (e.g. user-agent headers and configuration settings) to combine separate sessions into coherent user profiles.

### 12.3.2 Sensitivity of data <sup>§p12</sup><sub>57</sub>

User agents should treat persistently stored data as potentially sensitive; it's quite possible for emails, calendar appointments, health records, or other confidential documents to be stored in this mechanism.

To this end, user agents should ensure that when deleting data, it is promptly deleted from the underlying storage.

## 12.4 Security <sup>§p12</sup><sub>57</sub>

### 12.4.1 DNS spoofing attacks <sup>§p12</sup><sub>57</sub>

Because of the potential for DNS spoofing attacks, one cannot guarantee that a host claiming to be in a certain domain really is from that domain. To mitigate this, pages can use TLS. Pages using TLS can be sure that only the user, software working on behalf of the user, and other pages using TLS that have certificates identifying them as being from the same domain, can access their storage areas.

### 12.4.2 Cross-directory attacks <sup>§p12</sup><sub>57</sub>

Different authors sharing one host name, for example users hosting content on the now defunct `geocities.com`, all share one local storage object. There is no feature to restrict the access by pathname. Authors on shared hosts are therefore urged to avoid using these features, as it would be trivial for other authors to read the data and overwrite it.

#### Note

*Even if a path-restriction feature was made available, the usual DOM scripting security model would make it trivial to bypass this protection and access the data from any path.*

### 12.4.3 Implementation risks <sup>§ p12</sup> <sub>58</sub>

The two primary risks when implementing these persistent storage features are letting hostile sites read information from other domains, and letting hostile sites write information that is then read from other domains.

Letting third-party sites read data that is not supposed to be read from their domain causes *information leakage*. For example, a user's shopping wishlist on one domain could be used by another domain for targeted advertising; or a user's work-in-progress confidential documents stored by a word-processing site could be examined by the site of a competing company.

Letting third-party sites write data to the persistent storage of other domains can result in *information spoofing*, which is equally dangerous. For example, a hostile site could add items to a user's wishlist; or a hostile site could set a user's session identifier to a known ID that the hostile site can then use to track the user's actions on the victim site.

Thus, strictly following the [origin](#)<sup>p898</sup> model described in this specification is important for user security.

## 13 The HTML syntax §<sup>p12</sup> 59

### Note

*This section only describes the rules for resources labeled with an [HTML MIME type](#). Rules for XML resources are discussed in the section below entitled "[The XML syntax](#)<sup>p1384</sup>".*

### 13.1 Writing HTML documents §<sup>p12</sup> 59

*This section only applies to documents, authoring tools, and markup generators. In particular, it does not apply to conformance checkers; conformance checkers must use the requirements given in the next section ("parsing HTML documents").*

Documents must consist of the following parts, in the given order:

1. Optionally, a single U+FEFF BYTE ORDER MARK (BOM) character.
2. Any number of [comments](#)<sup>p1270</sup> and [ASCII whitespace](#).
3. A [DOCTYPE](#)<sup>p1259</sup>.
4. Any number of [comments](#)<sup>p1270</sup> and [ASCII whitespace](#).
5. The [document element](#), in the form of an [html](#)<sup>p172</sup> [element](#)<sup>p1260</sup>.
6. Any number of [comments](#)<sup>p1270</sup> and [ASCII whitespace](#).

The various types of content mentioned above are described in the next few sections.

In addition, there are some restrictions on how [character encoding declarations](#)<sup>p199</sup> are to be serialized, as discussed in the section on that topic.

### Note

*[ASCII whitespace](#) before the [html](#)<sup>p172</sup> element, at the start of the [html](#)<sup>p172</sup> element and before the [head](#)<sup>p173</sup> element, will be dropped when the document is parsed; [ASCII whitespace](#) after the [html](#)<sup>p172</sup> element will be parsed as if it were at the end of the [body](#)<sup>p205</sup> element. Thus, [ASCII whitespace](#) around the [document element](#) does not round-trip.*

*It is suggested that newlines be inserted after the DOCTYPE, after any comments that are before the document element, after the [html](#)<sup>p172</sup> element's start tag (if it is not [omitted](#)<sup>p1263</sup>), and after any comments that are inside the [html](#)<sup>p172</sup> element but before the [head](#)<sup>p173</sup> element.*

Many strings in the HTML syntax (e.g. the names of elements and their attributes) are case-insensitive, but only for [ASCII upper alphas](#) and [ASCII lower alphas](#). For convenience, in this section this is just referred to as "case-insensitive".

#### 13.1.1 The DOCTYPE §<sup>p12</sup> 59

A **DOCTYPE** is a required preamble.

### Note

*DOCTYPEs are required for legacy reasons. When omitted, browsers tend to use a different rendering mode that is incompatible with some specifications. Including the DOCTYPE in a document ensures that the browser makes a best-effort attempt at following the relevant specifications.*

A DOCTYPE must consist of the following components, in this order:

1. A string that is an [ASCII case-insensitive](#) match for the string "<!DOCTYPE".
2. One or more [ASCII whitespace](#).

3. A string that is an [ASCII case-insensitive](#) match for the string "html".
4. Optionally, a [DOCTYPE legacy string](#)<sup>p1260</sup>.
5. Zero or more [ASCII whitespace](#).
6. A U+003E GREATER-THAN SIGN character (>).

#### Note

*In other words, <!DOCTYPE html>, case-insensitively.*

For the purposes of HTML generators that cannot output HTML markup with the short DOCTYPE "<!DOCTYPE html>", a **DOCTYPE legacy string** may be inserted into the DOCTYPE (in the position defined above). This string must consist of:

1. One or more [ASCII whitespace](#).
2. A string that is an [ASCII case-insensitive](#) match for the string "SYSTEM".
3. One or more [ASCII whitespace](#).
4. A U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (the *quote mark*).
5. The literal string "[about:legacy-compat](#)"<sup>p96</sup>.
6. A matching U+0022 QUOTATION MARK or U+0027 APOSTROPHE character (i.e. the same character as in the earlier step labeled *quote mark*).

#### Note

*In other words, <!DOCTYPE html SYSTEM "about:legacy-compat"> or <!DOCTYPE html SYSTEM 'about:legacy-compat'>, case-insensitively except for the part in single or double quotes.*

The [DOCTYPE legacy string](#)<sup>p1260</sup> should not be used unless the document is generated from a system that cannot output the shorter string.

### 13.1.2 Elements <sup>p12</sup><sub>60</sub>

There are six different kinds of **elements**: [void elements](#)<sup>p1260</sup>, [the template element](#)<sup>p1260</sup>, [raw text elements](#)<sup>p1260</sup>, [escapable raw text elements](#)<sup>p1260</sup>, [foreign elements](#)<sup>p1260</sup>, and [normal elements](#)<sup>p1260</sup>.

#### Void elements

[area](#)<sup>p471</sup>, [base](#)<sup>p175</sup>, [br](#)<sup>p299</sup>, [col](#)<sup>p488</sup>, [embed](#)<sup>p399</sup>, [hr](#)<sup>p231</sup>, [img](#)<sup>p346</sup>, [input](#)<sup>p520</sup>, [link](#)<sup>p177</sup>, [meta](#)<sup>p189</sup>, [source](#)<sup>p343</sup>, [track](#)<sup>p411</sup>, [wbr](#)<sup>p300</sup>

#### The template element

[template](#)<sup>p671</sup>

#### Raw text elements

[script](#)<sup>p652</sup>, [style](#)<sup>p200</sup>

#### Escapable raw text elements

[textarea](#)<sup>p579</sup>, [title](#)<sup>p174</sup>

#### Foreign elements

Elements from the [MathML namespace](#) and the [SVG namespace](#).

#### Normal elements

All other allowed [HTML elements](#)<sup>p45</sup> are normal elements.

**Tags** are used to delimit the start and end of elements in the markup. [Raw text](#)<sup>p1260</sup>, [escapable raw text](#)<sup>p1260</sup>, and [normal](#)<sup>p1260</sup> elements have a [start tag](#)<sup>p1261</sup> to indicate where they begin, and an [end tag](#)<sup>p1262</sup> to indicate where they end. The start and end tags of certain [normal elements](#)<sup>p1260</sup> can be [omitted](#)<sup>p1263</sup>, as described below in the section on [optional tags](#)<sup>p1263</sup>. Those that cannot be omitted must not be omitted. [Void elements](#)<sup>p1260</sup> only have a start tag; end tags must not be specified for [void elements](#)<sup>p1260</sup>. [Foreign elements](#)<sup>p1260</sup> must either have a start tag and an end tag, or a start tag that is marked as self-closing, in which case they must not have an end tag.

The [contents](#)<sup>p147</sup> of the element must be placed between just after the start tag (which [might be implied, in certain cases](#)<sup>p1263</sup>) and just before the end tag (which again, [might be implied in certain cases](#)<sup>p1263</sup>). The exact allowed contents of each individual element depend on the [content model](#)<sup>p147</sup> of that element, as described earlier in this specification. Elements must not contain content that their content model disallows. In addition to the restrictions placed on the contents by those content models, however, the five types of elements have additional *syntactic* requirements.

[Void elements](#)<sup>p1260</sup> can't have any contents (since there's no end tag, no content can be put between the start tag and the end tag).

The [template element](#)<sup>p1260</sup> can have [template contents](#)<sup>p673</sup>, but such [template contents](#)<sup>p673</sup> are not children of the [template](#)<sup>p671</sup> element itself. Instead, they are stored in a [DocumentFragment](#) associated with a different [Document](#)<sup>p130</sup> — without a [browsing context](#)<sup>p998</sup> — so as to avoid the [template](#)<sup>p671</sup> contents interfering with the main [Document](#)<sup>p130</sup>. The markup for the [template contents](#)<sup>p673</sup> of a [template](#)<sup>p671</sup> element is placed just after the [template](#)<sup>p671</sup> element's start tag and just before [template](#)<sup>p671</sup> element's end tag (as with other elements), and may consist of any [text](#)<sup>p1269</sup>, [character references](#)<sup>p1269</sup>, [elements](#)<sup>p1260</sup>, and [comments](#)<sup>p1270</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1270</sup>.

[Raw text elements](#)<sup>p1260</sup> can have [text](#)<sup>p1269</sup>, though it has [restrictions](#)<sup>p1269</sup> described below.

[Escapable raw text elements](#)<sup>p1260</sup> can have [text](#)<sup>p1269</sup> and [character references](#)<sup>p1269</sup>, but the text must not contain an [ambiguous ampersand](#)<sup>p1270</sup>. There are also [further restrictions](#)<sup>p1269</sup> described below.

[Foreign elements](#)<sup>p1260</sup> whose start tag is marked as self-closing can't have any contents (since, again, as there's no end tag, no content can be put between the start tag and the end tag). [Foreign elements](#)<sup>p1260</sup> whose start tag is *not* marked as self-closing can have [text](#)<sup>p1269</sup>, [character references](#)<sup>p1269</sup>, [CDATA sections](#)<sup>p1270</sup>, other [elements](#)<sup>p1260</sup>, and [comments](#)<sup>p1270</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1270</sup>.

#### Note

*The HTML syntax does not support namespace declarations, even in [foreign elements](#)<sup>p1260</sup>.*

*For instance, consider the following HTML fragment:*

```
<p>
  <svg>
    <metadata>
      <!-- this is invalid -->
      <cdr:license xmlns:cdr="https://www.example.com/cdr/metadata" name="MIT"/>
    </metadata>
  </svg>
</p>
```

*The innermost element, cdr:license, is actually in the SVG namespace, as the "xmlns:cdr" attribute has no effect (unlike in XML). In fact, as the comment in the fragment above says, the fragment is actually non-conforming. This is because SVG 2 does not define any elements called "cdr:license" in the SVG namespace.*

[Normal elements](#)<sup>p1260</sup> can have [text](#)<sup>p1269</sup>, [character references](#)<sup>p1269</sup>, other [elements](#)<sup>p1260</sup>, and [comments](#)<sup>p1270</sup>, but the text must not contain the character U+003C LESS-THAN SIGN (<) or an [ambiguous ampersand](#)<sup>p1270</sup>. Some [normal elements](#)<sup>p1260</sup> also have [yet more restrictions](#)<sup>p1269</sup> on what content they are allowed to hold, beyond the restrictions imposed by the content model and those described in this paragraph. Those restrictions are described below.

Tags contain a **tag name**, giving the element's name. HTML elements all have names that only use [ASCII alphanumerics](#). In the HTML syntax, tag names, even those for [foreign elements](#)<sup>p1260</sup>, may be written with any mix of lower- and uppercase letters that, when converted to all-lowercase, matches the element's tag name; tag names are case-insensitive.

#### 13.1.2.1 Start tags <sup>§ p1261</sup>

**Start tags** must have the following format:

1. The first character of a start tag must be a U+003C LESS-THAN SIGN character (<).
2. The next few characters of a start tag must be the element's [tag name](#)<sup>p1261</sup>.
3. If there are to be any attributes in the next step, there must first be one or more [ASCII whitespace](#).
4. Then, the start tag may have a number of attributes, the [syntax for which](#)<sup>p1262</sup> is described below. Attributes must be separated from each other by one or more [ASCII whitespace](#).
5. After the attributes, or after the [tag name](#)<sup>p1261</sup> if there are no attributes, there may be one or more [ASCII whitespace](#). (Some attributes are required to be followed by a space. See the [attributes section](#)<sup>p1262</sup> below.)
6. Then, if the element is one of the [void elements](#)<sup>p1260</sup>, or if the element is a [foreign element](#)<sup>p1260</sup>, then there may be a single U+002F SOLIDUS character (/), which on [foreign elements](#)<sup>p1260</sup> marks the start tag as self-closing. On [void elements](#)<sup>p1260</sup>, it

does not mark the start tag as self-closing but instead is unnecessary and has no effect of any kind. For such void elements, it should be used only with caution — especially since, if directly preceded by an [unquoted attribute value](#)<sup>p1262</sup>, it becomes part of the attribute value rather than being discarded by the parser.

7. Finally, start tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 13.1.2.2 End tags <sup>p12</sup><sub>62</sub>

**End tags** must have the following format:

1. The first character of an end tag must be a U+003C LESS-THAN SIGN character (<).
2. The second character of an end tag must be a U+002F SOLIDUS character (/).
3. The next few characters of an end tag must be the element's [tag name](#)<sup>p1261</sup>.
4. After the tag name, there may be one or more [ASCII whitespace](#).
5. Finally, end tags must be closed by a U+003E GREATER-THAN SIGN character (>).

### 13.1.2.3 Attributes <sup>p12</sup><sub>62</sub>

**Attributes** for an element are expressed inside the element's start tag.

Attributes have a name and a value. **Attribute names** must consist of one or more characters other than [controls](#), U+0020 SPACE, U+0022 ("), U+0027 ('), U+003E (>), U+002F (/), U+003D (=), and [noncharacters](#). In the HTML syntax, attribute names, even those for [foreign elements](#)<sup>p1260</sup>, may be written with any mix of [ASCII lower](#) and [ASCII upper alphas](#).

**Attribute values** are a mixture of [text](#)<sup>p1269</sup> and [character references](#)<sup>p1269</sup>, except with the additional restriction that the text cannot contain an [ambiguous ampersand](#)<sup>p1270</sup>.

Attributes can be specified in four different ways:

#### Empty attribute syntax

Just the [attribute name](#)<sup>p1262</sup>. The value is implicitly the empty string.

#### Example

In the following example, the [disabled](#)<sup>p601</sup> attribute is given with the empty attribute syntax:

```
<input disabled>
```

If an attribute using the empty attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

#### Unquoted attribute value syntax

The [attribute name](#)<sup>p1262</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by the [attribute value](#)<sup>p1262</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal [ASCII whitespace](#), any U+0022 QUOTATION MARK characters ("), U+0027 APOSTROPHE characters ('), U+003D EQUALS SIGN characters (=), U+003C LESS-THAN SIGN characters (<), U+003E GREATER-THAN SIGN characters (>), or U+0060 GRAVE ACCENT characters (`), and must not be the empty string.

#### Example

In the following example, the [value](#)<sup>p525</sup> attribute is given with the unquoted attribute value syntax:

```
<input value=yes>
```

If an attribute using the unquoted attribute syntax is to be followed by another attribute or by the optional U+002F SOLIDUS character (/) allowed in step 6 of the [start tag](#)<sup>p1261</sup> syntax above, then there must be [ASCII whitespace](#) separating the two.

Single-quoted attribute value syntax

The [attribute name](#)<sup>p1262</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by a single U+0027 APOSTROPHE character ('), followed by the [attribute value](#)<sup>p1262</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0027 APOSTROPHE characters ('), and finally followed by a second single U+0027 APOSTROPHE character (').

Example

In the following example, the [type](#)<sup>p523</sup> attribute is given with the single-quoted attribute value syntax:

```
<input type='checkbox'>
```

If an attribute using the single-quoted attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

Double-quoted attribute value syntax

The [attribute name](#)<sup>p1262</sup>, followed by zero or more [ASCII whitespace](#), followed by a single U+003D EQUALS SIGN character, followed by zero or more [ASCII whitespace](#), followed by a single U+0022 QUOTATION MARK character ("), followed by the [attribute value](#)<sup>p1262</sup>, which, in addition to the requirements given above for attribute values, must not contain any literal U+0022 QUOTATION MARK characters ("), and finally followed by a second single U+0022 QUOTATION MARK character (").

Example

In the following example, the [name](#)<sup>p599</sup> attribute is given with the double-quoted attribute value syntax:

```
<input name="be evil">
```

If an attribute using the double-quoted attribute syntax is to be followed by another attribute, then there must be [ASCII whitespace](#) separating the two.

There must never be two or more attributes on the same start tag whose names are an [ASCII case-insensitive](#) match for each other.

When a [foreign element](#)<sup>p1260</sup> has one of the namespaced attributes given by the local name and namespace of the first and second cells of a row from the following table, it must be written using the name given by the third cell from the same row.

Local name	Namespace	Attribute name
actuate	<a href="#">XLink namespace</a>	xlink:actuate
arcrole	<a href="#">XLink namespace</a>	xlink:arcrole
href	<a href="#">XLink namespace</a>	xlink:href
role	<a href="#">XLink namespace</a>	xlink:role
show	<a href="#">XLink namespace</a>	xlink:show
title	<a href="#">XLink namespace</a>	xlink:title
type	<a href="#">XLink namespace</a>	xlink:type
lang	<a href="#">XML namespace</a>	xml:lang
space	<a href="#">XML namespace</a>	xml:space
xmlns	<a href="#">XMLNS namespace</a>	xmlns
xlink	<a href="#">XMLNS namespace</a>	xmlns:xlink

No other namespaced attribute can be expressed in [the HTML syntax](#)<sup>p1259</sup>.

Note

*Whether the attributes in the table above are conforming or not is defined by other specifications (e.g. SVG 2 and MathML); this section only describes the syntax rules if the attributes are serialized using the HTML syntax.*

13.1.2.4 Optional tags <sup>p12</sup><sub>63</sub>

Certain tags can be **omitted**.

## Note

Omitting an element's [start tag](#)<sup>p1261</sup> in the situations described below does not mean the element is not present; it is implied, but it is still there. For example, an HTML document always has a root [html](#)<sup>p172</sup> element, even if the string `<html>` doesn't appear anywhere in the markup.

An [html](#)<sup>p172</sup> element's [start tag](#)<sup>p1261</sup> may be omitted if the first thing inside the [html](#)<sup>p172</sup> element is not a [comment](#)<sup>p1270</sup>.

## Example

For example, in the following case it's ok to remove the "`<html>`" tag:

```
<!DOCTYPE HTML>
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

Doing so would make the document look like this:

```
<!DOCTYPE HTML>

  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

This has the exact same DOM. In particular, note that whitespace around the [document element](#) is ignored by the parser. The following example would also have the exact same DOM:

```
<!DOCTYPE HTML><head>
  <title>Hello</title>
</head>
<body>
  <p>Welcome to this example.</p>
</body>
</html>
```

However, in the following example, removing the start tag moves the comment to before the [html](#)<sup>p172</sup> element:

```
<!DOCTYPE HTML>
<html>
  <!-- where is this comment in the DOM? -->
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>
```

With the tag removed, the document actually turns into the same as this:

```
<!DOCTYPE HTML>
```

```

<!-- where is this comment in the DOM? -->
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>

```

This is why the tag can only be removed if it is not followed by a comment: removing the tag when there is a comment there changes the document's resulting parse tree. Of course, if the position of the comment does not matter, then the tag can be omitted, as if the comment had been moved to before the start tag in the first place.

An [html<sup>p172</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [html<sup>p172</sup>](#) element is not immediately followed by a [comment<sup>p1270</sup>](#).

A [head<sup>p173</sup>](#) element's [start tag<sup>p1261</sup>](#) may be omitted if the element is empty, or if the first thing inside the [head<sup>p173</sup>](#) element is an element.

A [head<sup>p173</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [head<sup>p173</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1270</sup>](#).

A [body<sup>p205</sup>](#) element's [start tag<sup>p1261</sup>](#) may be omitted if the element is empty, or if the first thing inside the [body<sup>p205</sup>](#) element is not [ASCII whitespace](#) or a [comment<sup>p1270</sup>](#), except if the first thing inside the [body<sup>p205</sup>](#) element is a [meta<sup>p189</sup>](#), [noscript<sup>p669</sup>](#), [link<sup>p177</sup>](#), [script<sup>p652</sup>](#), [style<sup>p200</sup>](#), or [template<sup>p671</sup>](#) element.

A [body<sup>p205</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [body<sup>p205</sup>](#) element is not immediately followed by a [comment<sup>p1270</sup>](#).

#### Example

Note that in the example above, the [head<sup>p173</sup>](#) element start and end tags, and the [body<sup>p205</sup>](#) element start tag, can't be omitted, because they are surrounded by whitespace:

```

<!DOCTYPE HTML>
<html>
  <head>
    <title>Hello</title>
  </head>
  <body>
    <p>Welcome to this example.</p>
  </body>
</html>

```

(The [body<sup>p205</sup>](#) and [html<sup>p172</sup>](#) element end tags could be omitted without trouble; any spaces after those get parsed into the [body<sup>p205</sup>](#) element anyway.)

Usually, however, whitespace isn't an issue. If we first remove the whitespace we don't care about:

```

<!DOCTYPE HTML><html><head><title>Hello</title></head><body><p>Welcome to this
example.</p></body></html>

```

Then we can omit a number of tags without affecting the DOM:

```

<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.</p>

```

At that point, we can also add some whitespace back:

```

<!DOCTYPE HTML>
<title>Hello</title>

```

```
<p>Welcome to this example.</p>
```

This would be equivalent to this document, with the omitted tags shown in their parser-implied positions; the only whitespace text node that results from this is the newline at the end of the [head<sup>p173</sup>](#) element:

```
<!DOCTYPE HTML>
<html><head><title>Hello</title>
</head><body><p>Welcome to this example.</p></body></html>
```

An [li<sup>p241</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [li<sup>p241</sup>](#) element is immediately followed by another [li<sup>p241</sup>](#) element or if there is no more content in the parent element.

A [dt<sup>p247</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [dt<sup>p247</sup>](#) element is immediately followed by another [dt<sup>p247</sup>](#) element or a [dd<sup>p248</sup>](#) element.

A [dd<sup>p248</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [dd<sup>p248</sup>](#) element is immediately followed by another [dd<sup>p248</sup>](#) element or a [dt<sup>p247</sup>](#) element, or if there is no more content in the parent element.

A [p<sup>p229</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [p<sup>p229</sup>](#) element is immediately followed by an [address<sup>p222</sup>](#), [article<sup>p206</sup>](#), [aside<sup>p214</sup>](#), [blockquote<sup>p235</sup>](#), [details<sup>p637</sup>](#), [dialog<sup>p646</sup>](#), [div<sup>p256</sup>](#), [dl<sup>p244</sup>](#), [fieldset<sup>p594</sup>](#), [figcaption<sup>p252</sup>](#), [figure<sup>p249</sup>](#), [footer<sup>p220</sup>](#), [form<sup>p514</sup>](#), [h1<sup>p216</sup>](#), [h2<sup>p216</sup>](#), [h3<sup>p216</sup>](#), [h4<sup>p216</sup>](#), [h5<sup>p216</sup>](#), [h6<sup>p216</sup>](#), [header<sup>p218</sup>](#), [hgroup<sup>p218</sup>](#), [hr<sup>p231</sup>](#), [main<sup>p253</sup>](#), [menu<sup>p240</sup>](#), [nav<sup>p211</sup>](#), [ol<sup>p238</sup>](#), [p<sup>p229</sup>](#), [pre<sup>p233</sup>](#), [search<sup>p254</sup>](#), [section<sup>p209</sup>](#), [table<sup>p478</sup>](#), or [ul<sup>p239</sup>](#) element, or if there is no more content in the parent element and the parent element is an [HTML element<sup>p45</sup>](#) that is not an [a<sup>p257</sup>](#), [audio<sup>p410</sup>](#), [del<sup>p338</sup>](#), [ins<sup>p337</sup>](#), [map<sup>p470</sup>](#), [noscript<sup>p669</sup>](#), or [video<sup>p406</sup>](#) element, or an [autonomous custom element<sup>p759</sup>](#).

#### Example

We can thus simplify the earlier example further:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.
```

An [rt<sup>p277</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [rt<sup>p277</sup>](#) element is immediately followed by an [rt<sup>p277</sup>](#) or [rp<sup>p277</sup>](#) element, or if there is no more content in the parent element.

An [rp<sup>p277</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [rp<sup>p277</sup>](#) element is immediately followed by an [rt<sup>p277</sup>](#) or [rp<sup>p277</sup>](#) element, or if there is no more content in the parent element.

An [optgroup<sup>p576</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [optgroup<sup>p576</sup>](#) element is immediately followed by another [optgroup<sup>p576</sup>](#) element, if it is immediately followed by an [hr<sup>p231</sup>](#) element, or if there is no more content in the parent element.

An [option<sup>p577</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [option<sup>p577</sup>](#) element is immediately followed by another [option<sup>p577</sup>](#) element, if it is immediately followed by an [optgroup<sup>p576</sup>](#) element, if it is immediately followed by an [hr<sup>p231</sup>](#) element, or if there is no more content in the parent element.

A [colgroup<sup>p487</sup>](#) element's [start tag<sup>p1261</sup>](#) may be omitted if the first thing inside the [colgroup<sup>p487</sup>](#) element is a [col<sup>p488</sup>](#) element, and if the element is not immediately preceded by another [colgroup<sup>p487</sup>](#) element whose [end tag<sup>p1262</sup>](#) has been omitted. (It can't be omitted if the element is empty.)

A [colgroup<sup>p487</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [colgroup<sup>p487</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1270</sup>](#).

A [caption<sup>p486</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [caption<sup>p486</sup>](#) element is not immediately followed by [ASCII whitespace](#) or a [comment<sup>p1270</sup>](#).

A [thead<sup>p490</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [thead<sup>p490</sup>](#) element is immediately followed by a [tbody<sup>p489</sup>](#) or [tfoot<sup>p491</sup>](#) element.

A [tbody<sup>p489</sup>](#) element's [start tag<sup>p1261</sup>](#) may be omitted if the first thing inside the [tbody<sup>p489</sup>](#) element is a [tr<sup>p492</sup>](#) element, and if the element is not immediately preceded by a [tbody<sup>p489</sup>](#), [thead<sup>p490</sup>](#), or [tfoot<sup>p491</sup>](#) element whose [end tag<sup>p1262</sup>](#) has been omitted. (It can't be omitted if the element is empty.)

A [tbody<sup>p489</sup>](#) element's [end tag<sup>p1262</sup>](#) may be omitted if the [tbody<sup>p489</sup>](#) element is immediately followed by a [tbody<sup>p489</sup>](#) or [tfoot<sup>p491</sup>](#)

element, or if there is no more content in the parent element.

A [tfoot](#)<sup>p491</sup> element's [end tag](#)<sup>p1262</sup> may be omitted if there is no more content in the parent element.

A [tr](#)<sup>p492</sup> element's [end tag](#)<sup>p1262</sup> may be omitted if the [tr](#)<sup>p492</sup> element is immediately followed by another [tr](#)<sup>p492</sup> element, or if there is no more content in the parent element.

A [td](#)<sup>p493</sup> element's [end tag](#)<sup>p1262</sup> may be omitted if the [td](#)<sup>p493</sup> element is immediately followed by a [td](#)<sup>p493</sup> or [th](#)<sup>p495</sup> element, or if there is no more content in the parent element.

A [th](#)<sup>p495</sup> element's [end tag](#)<sup>p1262</sup> may be omitted if the [th](#)<sup>p495</sup> element is immediately followed by a [td](#)<sup>p493</sup> or [th](#)<sup>p495</sup> element, or if there is no more content in the parent element.

#### Example

The ability to omit all these table-related tags makes table markup much terser.

Take this example:

```
<table>
  <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)</caption>
  <colgroup><col><col><col></colgroup>
  <thead>
    <tr>
      <th>Function</th>
      <th>Control Unit</th>
      <th>Central Station</th>
    </tr>
  </thead>
  <tbody>
    <tr>
      <td>Headlights</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Interior Lights</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Electric locomotive operating sounds</td>
      <td>✓</td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Engineer's cab lighting</td>
      <td></td>
      <td>✓</td>
    </tr>
    <tr>
      <td>Station Announcements - Swiss</td>
      <td></td>
      <td>✓</td>
    </tr>
  </tbody>
</table>
```

The exact same table, modulo some whitespace differences, could be marked up as follows:

```
<table>
  <caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)
```

```

<colgroup><col><col><col>
<thead>
<tr>
  <th>Function
  <th>Control Unit
  <th>Central Station
</thead>
<tbody>
<tr>
  <td>Headlights
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Interior Lights
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Electric locomotive operating sounds
  <td>✓
  <td>✓
</tr>
<tr>
  <td>Engineer's cab lighting
  <td>
  <td>✓
</tr>
<tr>
  <td>Station Announcements - Swiss
  <td>
  <td>✓
</tr>
</tbody>
</table>

```

Since the cells take up much less room this way, this can be made even terser by having each row on one line:

```

<table>
<caption>37547 TEE Electric Powered Rail Car Train Functions (Abbreviated)
<colgroup><col><col><col>
<thead>
<tr> <th>Function                <th>Control Unit    <th>Central Station
</thead>
<tbody>
<tr> <td>Headlights              <td>✓              <td>✓
<tr> <td>Interior Lights         <td>✓              <td>✓
<tr> <td>Electric locomotive operating sounds <td>✓              <td>✓
<tr> <td>Engineer's cab lighting <td>                <td>✓
<tr> <td>Station Announcements - Swiss <td>                <td>✓
</tbody>
</table>

```

The only differences between these tables, at the DOM level, is with the precise position of the (in any case semantically-neutral) whitespace.

**However**, a [start tag](#)<sup>p1261</sup> must never be omitted if it has any attributes.

#### Example

Returning to the earlier example with all the whitespace removed and then all the optional tags removed:

```
<!DOCTYPE HTML><title>Hello</title><p>Welcome to this example.
```

If the [body](#)<sup>p205</sup> element in this example had to have a [class](#)<sup>p154</sup> attribute and the [html](#)<sup>p172</sup> element had to have a [lang](#)<sup>p158</sup> attribute, the markup would have to become:

```
<!DOCTYPE HTML><html lang="en"><title>Hello</title><body class="demo"><p>Welcome to this example.
```

## Note

This section assumes that the document is conforming, in particular, that there are no [content model](#)<sup>p147</sup> violations. Omitting tags in the fashion described in this section in a document that does not conform to the [content models](#)<sup>p147</sup> described in this specification is likely to result in unexpected DOM differences (this is, in part, what the content models are designed to avoid).

### 13.1.2.5 Restrictions on content models § p12 69

For historical reasons, certain elements have extra restrictions beyond even the restrictions given by their content model.

A [table](#)<sup>p478</sup> element must not contain [tr](#)<sup>p492</sup> elements, even though these elements are technically allowed inside [table](#)<sup>p478</sup> elements according to the content models described in this specification. (If a [tr](#)<sup>p492</sup> element is put inside a [table](#)<sup>p478</sup> in the markup, it will in fact imply a [tbody](#)<sup>p489</sup> start tag before it.)

A single [newline](#)<sup>p1269</sup> may be placed immediately after the [start tag](#)<sup>p1261</sup> of [pre](#)<sup>p233</sup> and [textarea](#)<sup>p579</sup> elements. This does not affect the processing of the element. The otherwise optional [newline](#)<sup>p1269</sup> must be included if the element's contents themselves start with a [newline](#)<sup>p1269</sup> (because otherwise the leading newline in the contents would be treated like the optional newline, and ignored).

## Example

The following two [pre](#)<sup>p233</sup> blocks are equivalent:

```
<pre>Hello</pre>
```

```
<pre>  
Hello</pre>
```

### 13.1.2.6 Restrictions on the contents of raw text and escapable raw text elements § p12 69

The text in [raw text](#)<sup>p1260</sup> and [escapable raw text elements](#)<sup>p1260</sup> must not contain any occurrences of the string "</" (U+003C LESS-THAN SIGN, U+002F SOLIDUS) followed by characters that case-insensitively match the tag name of the element followed by one of U+0009 CHARACTER TABULATION (tab), U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), U+0020 SPACE, U+003E GREATER-THAN SIGN (>), or U+002F SOLIDUS (/).

### 13.1.3 Text § p12 69

**Text** is allowed inside elements, attribute values, and comments. Extra constraints are placed on what is and what is not allowed in text based on where the text is to be put, as described in the other sections.

#### 13.1.3.1 Newlines § p12 69

**Newlines** in HTML may be represented either as U+000D CARRIAGE RETURN (CR) characters, U+000A LINE FEED (LF) characters, or pairs of U+000D CARRIAGE RETURN (CR), U+000A LINE FEED (LF) characters in that order.

Where [character references](#)<sup>p1269</sup> are allowed, a character reference of a U+000A LINE FEED (LF) character (but not a U+000D CARRIAGE RETURN (CR) character) also represents a [newline](#)<sup>p1269</sup>.

### 13.1.4 Character references § p12 69

In certain cases described in other sections, [text](#)<sup>p1269</sup> may be mixed with **character references**. These can be used to escape characters that couldn't otherwise legally be included in [text](#)<sup>p1269</sup>.

Character references must start with a U+0026 AMPERSAND character (&). Following this, there are three possible kinds of character references:

## Named character references

The ampersand must be followed by one of the names given in the [named character references](#)<sup>p1374</sup> section, using the same case. The name must be one that is terminated by a U+003B SEMICOLON character (;).

## Decimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), followed by one or more [ASCII digits](#), representing a base-ten integer that corresponds to a code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

## Hexadecimal numeric character reference

The ampersand must be followed by a U+0023 NUMBER SIGN character (#), which must be followed by either a U+0078 LATIN SMALL LETTER X character (x) or a U+0058 LATIN CAPITAL LETTER X character (X), which must then be followed by one or more [ASCII hex digits](#), representing a hexadecimal integer that corresponds to a code point that is allowed according to the definition below. The digits must then be followed by a U+003B SEMICOLON character (;).

The numeric character reference forms described above are allowed to reference any code point excluding U+000D CR, [noncharacters](#), and [controls](#) other than [ASCII whitespace](#).

An **ambiguous ampersand** is a U+0026 AMPERSAND character (&) that is followed by one or more [ASCII alphanumerics](#), followed by a U+003B SEMICOLON character (;), where these characters do not match any of the names given in the [named character references](#)<sup>p1374</sup> section.

## 13.1.5 CDATA sections §<sup>p12</sup><sub>70</sub>

**CDATA sections** must consist of the following components, in this order:

1. The string "<![CDATA[".
2. Optionally, [text](#)<sup>p1269</sup>, with the additional restriction that the text must not contain the string "]]>".
3. The string "]]>".

### Example

CDATA sections can only be used in foreign content (MathML or SVG). In this example, a CDATA section is used to escape the contents of a [MathML](#) `ms` element:

```
<p>You can add a string to a number, but this stringifies the number:</p>
<math>
  <ms><![CDATA[x<y]]></ms>
  <mo>+</mo>
  <mn>3</mn>
  <mo>=</mo>
  <ms><![CDATA[x<y3]]></ms>
</math>
```

## 13.1.6 Comments §<sup>p12</sup><sub>70</sub>

**Comments** must have the following format:

1. The string "<!--".
2. Optionally, [text](#)<sup>p1269</sup>, with the additional restriction that the text must not start with the string ">", nor start with the string "-->", nor contain the strings "<!--", "-->", or "--!>", nor end with the string "<!--".
3. The string "-->".

### Note

The [text](#)<sup>p1269</sup> is allowed to end with the string "<!--", as in <!--My favorite operators are > and <!-->.

## 13.2 Parsing HTML documents <sup>§<sup>p12</sup></sup> <sup>71</sup>

This section only applies to user agents, data mining tools, and conformance checkers.

### Note

The rules for parsing XML documents into DOM trees are covered by the next section, entitled "[The XML syntax<sup>p1384</sup>](#)".

User agents must use the parsing rules described in this section to generate the DOM trees from [text/html<sup>p1444</sup>](#) resources. Together, these rules define what is referred to as the **HTML parser**.

### Note

While the HTML syntax described in this specification bears a close resemblance to SGML and XML, it is a separate language with its own parsing rules.

Some earlier versions of HTML (in particular from HTML2 to HTML4) were based on SGML and used SGML parsing rules. However, few (if any) web browsers ever implemented true SGML parsing for HTML documents; the only user agents to strictly handle HTML as an SGML application have historically been validators. The resulting confusion — with validators claiming documents to have one representation while widely deployed web browsers interoperably implemented a different representation — has wasted decades of productivity. This version of HTML thus returns to a non-SGML basis.

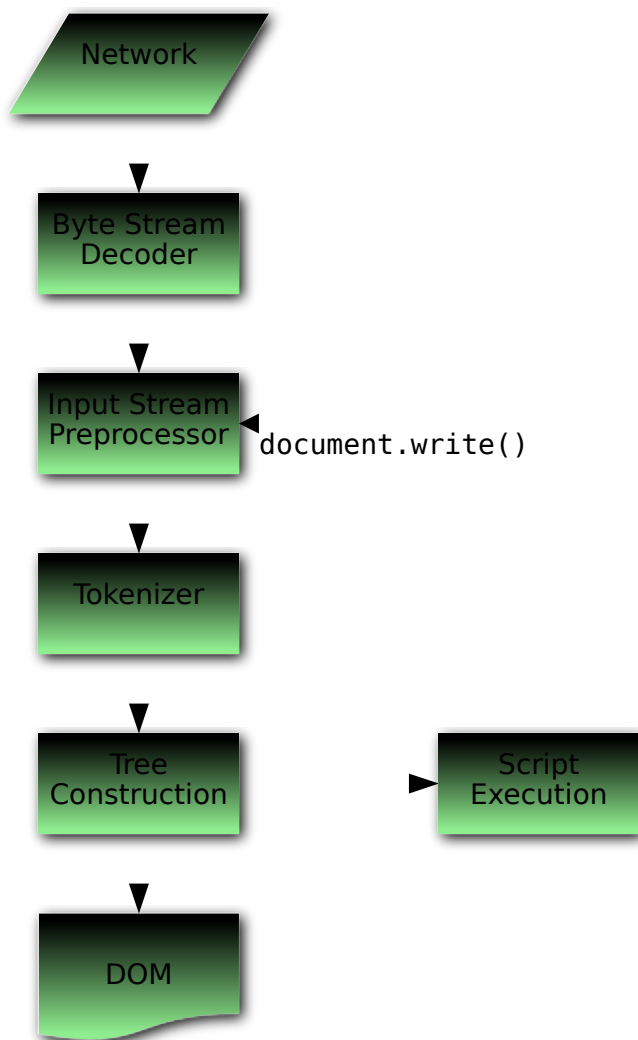

Authors interested in using SGML tools in their authoring pipeline are encouraged to use XML tools and the XML serialization of HTML.

For the purposes of conformance checkers, if a resource is determined to be in [the HTML syntax<sup>p1259</sup>](#), then it is an [HTML document](#).

### Note

As stated [in the terminology section<sup>p45</sup>](#), references to [element types<sup>p45</sup>](#) that do not explicitly specify a namespace always refer to elements in the [HTML namespace](#). For example, if the spec talks about "a [menu<sup>p240</sup>](#) element", then that is an element with the local name "menu", the namespace "[http://www.w3.org/1999/xhtml](#)", and the interface [HTMLMenuElement<sup>p241</sup>](#). Where possible, references to such elements are hyperlinked to their definition.

### 13.2.1 Overview of the parsing model <sup>§ p12</sup> <sub>72</sub>

The input to the HTML parsing process consists of a stream of [code points](#)<sup>p12</sup>, which is passed through a [tokenization](#)<sup>p1290</sup> stage followed by a [tree construction](#)<sup>p1318</sup> stage. The output is a [Document](#)<sup>p139</sup> object.

#### Note

*Implementations that [do not support scripting](#)<sup>p48</sup> do not have to actually create a DOM [Document](#)<sup>p139</sup> object, but the DOM tree in such cases is still used as the model for the rest of the specification.*

In the common case, the data handled by the tokenization stage comes from the network, but [it can also come from script](#)<sup>p1150</sup> running in the user agent, e.g. using the [document.write\(\)](#)<sup>p1153</sup> API.

There is only one set of states for the tokenizer stage and the tree construction stage, but the tree construction stage is reentrant, meaning that while the tree construction stage is handling one token, the tokenizer might be resumed, causing further tokens to be emitted and processed before the first token's processing is complete.

#### Example

In the following example, the tree construction stage will be called upon to handle a "p" start tag token while handling the "script" end tag token:

```
...
<script>
  document.write('<p>');
</script>
...
```

To handle these cases, parsers have a **script nesting level**, which must be initially set to zero, and a **parser pause flag**, which must be initially set to false.

### 13.2.2 Parse errors <sup>§p12</sup><sub>73</sub>

This specification defines the parsing rules for HTML documents, whether they are syntactically correct or not. Certain points in the parsing algorithm are said to be [parse errors](#)<sup>p1273</sup>. The error handling for parse errors is well-defined (that's the processing rules described throughout this specification), but user agents, while parsing an HTML document, may [abort the parser](#)<sup>p1359</sup> at the first [parse error](#)<sup>p1273</sup> that they encounter for which they do not wish to apply the rules described in this specification.

Conformance checkers must report at least one parse error condition to the user if one or more parse error conditions exist in the document and must not report parse error conditions if none exist in the document. Conformance checkers may report more than one parse error condition if more than one parse error condition exists in the document.

#### Note

*Parse errors are only errors with the syntax of HTML. In addition to checking for parse errors, conformance checkers will also verify that the document obeys all the other conformance requirements described in this specification.*

Some parse errors have dedicated codes outlined in the table below that should be used by conformance checkers in reports.

*Error descriptions in the table below are non-normative.*

Code	Description
<b>abrupt-closing-of-empty-comment</b>	This error occurs if the parser encounters an empty <a href="#">comment</a> <sup>p1270</sup> that is abruptly closed by a U+003E (>) <a href="#">code point</a> (i.e., <!--> or <!-->). The parser behaves as if the comment is closed correctly.
<b>abrupt-doctype-public-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> in the <a href="#">DOCTYPE</a> <sup>p1259</sup> public identifier (e.g., <!DOCTYPE html PUBLIC "foo">). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p139</sup> to <a href="#">quirks mode</a> .
<b>abrupt-doctype-system-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> in the <a href="#">DOCTYPE</a> <sup>p1259</sup> system identifier (e.g., <!DOCTYPE html PUBLIC "-//W3C//DTD HTML 4.01//EN" "foo">). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p139</sup> to <a href="#">quirks mode</a> .
<b>absence-of-digits-in-numeric-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference</a> <sup>p1269</sup> that doesn't contain any digits (e.g., &#qux;). In this case the parser doesn't resolve the character reference.
<b>cdata-in-html-content</b>	This error occurs if the parser encounters a <a href="#">CDATA section</a> <sup>p1270</sup> outside of foreign content (SVG or MathML). The parser treats such CDATA sections (including leading "[CDATA[" and trailing "]" strings) as comments.
<b>character-reference-outside-unicode-range</b>	This error occurs if the parser encounters a numeric <a href="#">character reference</a> <sup>p1269</sup> that references a <a href="#">code point</a> that is greater than the valid Unicode range. The parser resolves such a character reference to a U+FFFD REPLACEMENT CHARACTER.
<b>control-character-in-input-stream</b>	This error occurs if the <a href="#">input stream</a> <sup>p1284</sup> contains a <a href="#">control code point</a> that is not <a href="#">ASCII whitespace</a> or U+0000 NULL. Such code points are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.
<b>control-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference</a> <sup>p1269</sup> that references a <a href="#">control code point</a> that is not <a href="#">ASCII whitespace</a> or is a U+000D CARRIAGE RETURN. The parser resolves such character references as-is except C1 control references that are replaced according to the <a href="#">numeric character reference end state</a> <sup>p1317</sup> .
<b>duplicate-attribute</b>	This error occurs if the parser encounters an <a href="#">attribute</a> <sup>p1262</sup> in a tag that already has an attribute with the same name. The parser ignores all such duplicate occurrences of the attribute.
<b>end-tag-with-attributes</b>	This error occurs if the parser encounters an <a href="#">end tag</a> <sup>p1262</sup> with <a href="#">attributes</a> <sup>p1262</sup> . Attributes in end tags are ignored and do not make their way into the DOM.
<b>end-tag-with-trailing-solidus</b>	This error occurs if the parser encounters an <a href="#">end tag</a> <sup>p1262</sup> that has a U+002F (/) <a href="#">code point</a> right before the closing U+003E (>) code point (e.g., </div/>). Such a tag is treated as a regular end tag.
<b>eof-before-tag-name</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1284</sup> where a tag name is expected. In this case the parser treats the beginning of a <a href="#">start tag</a> <sup>p1261</sup> (i.e., <) or an <a href="#">end tag</a> <sup>p1262</sup> (i.e., </) as text content.

Code	Description
<b>eof-in-cdata</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1284</sup> in a <a href="#">CDATA section</a> <sup>p1270</sup> . The parser treats such CDATA sections as if they are closed immediately before the end of the input stream.
<b>eof-in-comment</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1284</sup> in a <a href="#">comment</a> <sup>p1270</sup> . The parser treats such comments as if they are closed immediately before the end of the input stream.
<b>eof-in-doctype</b>	This error occurs if the parser encounters the end of the input stream in a <a href="#">DOCTYPE</a> <sup>p1259</sup> . In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p130</sup> to <a href="#">quirks mode</a> .
<b>eof-in-script-html-comment-like-text</b>	<p>This error occurs if the parser encounters the end of the <a href="#">input stream</a><sup>p1284</sup> in text that resembles an <a href="#">HTML comment</a><sup>p1270</sup> inside <a href="#">script</a><sup>p652</sup> element content (e.g., <code>&lt;script&gt;&lt;!-- foo</code>).</p> <div> <p><b>Note</b></p> <p><i>Syntactic structures that resemble HTML comments in <a href="#">script</a><sup>p652</sup> elements are parsed as text content. They can be a part of a scripting language-specific syntactic structure or be treated as an HTML-like comment, if the scripting language supports them (e.g., parsing rules for HTML-like comments can be found in Annex B of the JavaScript specification). The common reason for this error is a violation of the <a href="#">restrictions for contents of script elements</a><sup>p666</sup>. <a href="#">[JAVASCRIPT]</a><sup>p1479</sup></i></p> </div>
<b>eof-in-tag</b>	This error occurs if the parser encounters the end of the <a href="#">input stream</a> <sup>p1284</sup> in a <a href="#">start tag</a> <sup>p1261</sup> or an <a href="#">end tag</a> <sup>p1262</sup> (e.g., <code>&lt;div id=</code> ). Such a tag is ignored.
<b>incorrectly-closed-comment</b>	This error occurs if the parser encounters a <a href="#">comment</a> <sup>p1270</sup> that is closed by the <code>"- - !&gt;"</code> <a href="#">code point</a> sequence. The parser treats such comments as if they are correctly closed by the <code>"- -&gt;"</code> code point sequence.
<b>incorrectly-opened-comment</b>	<p>This error occurs if the parser encounters the <code>"&lt;!"</code> <a href="#">code point</a> sequence that is not immediately followed by two U+002D (-) code points and that is not the start of a <a href="#">DOCTYPE</a><sup>p1259</sup> or a <a href="#">CDATA section</a><sup>p1270</sup>. All content that follows the <code>"&lt;!"</code> code point sequence up to a U+003E (&gt;) code point (if present) or to the end of the <a href="#">input stream</a><sup>p1284</sup> is treated as a comment.</p> <div> <p><b>Note</b></p> <p><i>One possible cause of this error is using an XML markup declaration (e.g., <code>&lt;!ELEMENT br EMPTY&gt;</code>) in HTML.</i></p> </div>
<b>invalid-character-sequence-after-doctype-name</b>	This error occurs if the parser encounters any <a href="#">code point</a> sequence other than "PUBLIC" and "SYSTEM" keywords after a <a href="#">DOCTYPE</a> <sup>p1259</sup> name. In such a case, the parser ignores any following public or system identifiers, and if the DOCTYPE is correctly placed as a document preamble, and if the <a href="#">parser cannot change the mode flag</a> <sup>p1325</sup> is false, sets the <a href="#">Document</a> <sup>p130</sup> to <a href="#">quirks mode</a> .
<b>invalid-first-character-of-tag-name</b>	<p>This error occurs if the parser encounters a <a href="#">code point</a> that is not an <a href="#">ASCII alpha</a> where first code point of a <a href="#">start tag</a><sup>p1261</sup> name or an <a href="#">end tag</a><sup>p1262</sup> name is expected. If a start tag was expected such code point and a preceding U+003C (&lt;) is treated as text content, and all content that follows is treated as markup. Whereas, if an end tag was expected, such code point and all content that follows up to a U+003E (&gt;) code point (if present) or to the end of the <a href="#">input stream</a><sup>p1284</sup> is treated as a comment.</p> <div> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;42&gt;&lt;/42&gt;</pre> <p>This will be parsed into:</p> <pre> Lhtml<sup>p172</sup> ├head<sup>p173</sup> │├body<sup>p205</sup> ││├#text: &lt;42&gt; ││└#comment: 42 </pre> </div> <div> <p><b>Note</b></p> <p><i>While the first code point of a tag name is limited to an <a href="#">ASCII alpha</a>, a wide range of code points (including <a href="#">ASCII digits</a>) is allowed in subsequent positions.</i></p> </div>
<b>missing-attribute-value</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where an <a href="#">attribute</a> <sup>p1262</sup> value is expected (e.g., <code>&lt;div id=</code> ). The parser treats the attribute as having an empty value.
<b>missing-doctype-name</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE</a> <sup>p1259</sup> that is missing a name (e.g., <code>&lt;!DOCTYPE&gt;</code> ). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p130</sup> to <a href="#">quirks mode</a> .
<b>missing-doctype-public-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where start of the <a href="#">DOCTYPE</a> <sup>p1259</sup> public identifier is expected (e.g., <code>&lt;!DOCTYPE html PUBLIC &gt;</code> ). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document</a> <sup>p130</sup> to <a href="#">quirks mode</a> .

Code	Description
<b>missing-doctype-system-identifier</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where start of the <a href="#">DOCTYPE<sup>p1259</sup></a> system identifier is expected (e.g., <!DOCTYPE html SYSTEM >). In such a case, if the DOCTYPE is correctly placed as a document preamble, the parser sets the <a href="#">Document<sup>p139</sup></a> to <a href="#">quirks mode</a> .
<b>missing-end-tag-name</b>	This error occurs if the parser encounters a U+003E (>) <a href="#">code point</a> where an <a href="#">end tag<sup>p1262</sup></a> name is expected, i.e., </>. The parser ignores the whole "</>" code point sequence.
<b>missing-quote-before-doctype-public-identifier</b>	This error occurs if the parser encounters the <a href="#">DOCTYPE<sup>p1259</sup></a> public identifier that is not preceded by a quote (e.g., <!DOCTYPE html PUBLIC -//W3C//DTD HTML 4.01//EN">). In such a case, the parser ignores the public identifier, and if the DOCTYPE is correctly placed as a document preamble, sets the <a href="#">Document<sup>p139</sup></a> to <a href="#">quirks mode</a> .
<b>missing-quote-before-doctype-system-identifier</b>	This error occurs if the parser encounters the <a href="#">DOCTYPE<sup>p1259</sup></a> system identifier that is not preceded by a quote (e.g., <!DOCTYPE html SYSTEM http://www.w3.org/TR/xhtml1/DTD/xhtml1-transitional.dtd">). In such a case, the parser ignores the system identifier, and if the DOCTYPE is correctly placed as a document preamble, sets the <a href="#">Document<sup>p139</sup></a> to <a href="#">quirks mode</a> .
<b>missing-semicolon-after-character-reference</b>	<p>This error occurs if the parser encounters a <a href="#">character reference<sup>p1269</sup></a> that is not terminated by a U+003B (;) <a href="#">code point</a>. Usually the parser behaves as if character reference is terminated by the U+003B (;) code point; however, there are some ambiguous cases in which the parser includes subsequent code points in the character reference.</p> <p><b>Example</b></p> <p>For example, &amp;not;in will be parsed as "¬in" whereas &amp;notin will be parsed as "£".</p>
<b>missing-whitespace-after-doctype-public-keyword</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1259</sup></a> whose "PUBLIC" keyword and public identifier are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-after-doctype-system-keyword</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1259</sup></a> whose "SYSTEM" keyword and system identifier are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-before-doctype-name</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1259</sup></a> whose "DOCTYPE" keyword and name are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-between-attributes</b>	This error occurs if the parser encounters <a href="#">attributes<sup>p1262</sup></a> that are not separated by <a href="#">ASCII whitespace</a> (e.g., <div id="foo" class="bar">). In this case the parser behaves as if ASCII whitespace is present.
<b>missing-whitespace-between-doctype-public-and-system-identifiers</b>	This error occurs if the parser encounters a <a href="#">DOCTYPE<sup>p1259</sup></a> whose public and system identifiers are not separated by <a href="#">ASCII whitespace</a> . In this case the parser behaves as if ASCII whitespace is present.
<b>nested-comment</b>	This error occurs if the parser encounters a nested <a href="#">comment<sup>p1270</sup></a> (e.g., <!-- <!-- nested --> -->). Such a comment will be closed by the first occurring "-->" <a href="#">code point</a> sequence and everything that follows will be treated as markup.
<b>noncharacter-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference<sup>p1269</sup></a> that references a <a href="#">noncharacter</a> . The parser resolves such character references as-is.
<b>noncharacter-in-input-stream</b>	This error occurs if the <a href="#">input stream<sup>p1284</sup></a> contains a <a href="#">noncharacter</a> . Such <a href="#">code points</a> are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.
<b>non-void-html-element-start-tag-with-trailing-solidus</b>	<p>This error occurs if the parser encounters a <a href="#">start tag<sup>p1261</sup></a> for an element that is not in the list of <a href="#">void elements<sup>p1260</sup></a> or is not a part of foreign content (i.e., not an SVG or MathML element) that has a U+002F (/) <a href="#">code point</a> right before the closing U+003E (&gt;) code point. The parser behaves as if the U+002F (/) is not present.</p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;div/&gt;&lt;span&gt;&lt;/span&gt;&lt;span&gt;&lt;/span&gt;</pre> <p>This will be parsed into:</p> <pre> Lhtml<sup>p172</sup> ├head<sup>p173</sup> │  body<sup>p205</sup> │    div<sup>p256</sup></pre>

Code	Description
	<div> <span>span</span><sup>p298</sup>  <span>span</span><sup>p298</sup> </div> <p><b>Note</b></p> <p>The trailing U+002F (/) in a start tag name can be used only in foreign content to specify self-closing tags. (Self-closing tags don't exist in HTML.) It is also allowed for void elements, but doesn't have any effect in this case.</p>
<b>null-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference</a> <sup>p1269</sup> that references a U+0000 NULL <a href="#">code point</a> . The parser resolves such character references to a U+FFFD REPLACEMENT CHARACTER.
<b>surrogate-character-reference</b>	This error occurs if the parser encounters a numeric <a href="#">character reference</a> <sup>p1269</sup> that references a <a href="#">surrogate</a> . The parser resolves such character references to a U+FFFD REPLACEMENT CHARACTER.
<b>surrogate-in-input-stream</b>	This error occurs if the <a href="#">input stream</a> <sup>p1284</sup> contains a <a href="#">surrogate</a> . Such <a href="#">code points</a> are parsed as-is and usually, where parsing rules don't apply any additional restrictions, make their way into the DOM.
	<p><b>Note</b></p> <p>Surrogates can only find their way into the input stream via script APIs such as <code>document.write()</code><sup>p1153</sup>.</p>
<b>unexpected-character-after-doctype-system-identifier</b>	This error occurs if the parser encounters any <a href="#">code points</a> other than <a href="#">ASCII whitespace</a> or closing U+003E (>) after the <a href="#">DOCTYPE</a> <sup>p1259</sup> system identifier. The parser ignores these code points.
<b>unexpected-character-in-attribute-name</b>	<p>This error occurs if the parser encounters a U+0022 ("), U+0027 ('), or U+003C (&lt;) <a href="#">code point</a> in an <a href="#">attribute name</a><sup>p1262</sup>. The parser includes such code points in the attribute name.</p> <p><b>Note</b></p> <p>Code points that trigger this error are usually a part of another syntactic construct and can be a sign of a typo around the attribute name.</p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;div foo&lt;div&gt;</pre> <p>Due to a forgotten U+003E (&gt;) code point after <code>foo</code> the parser treats this markup as a single <a href="#">div</a><sup>p256</sup> element with a <code>"foo&lt;div"</code> attribute.</p> <p>As another example of this error, consider the following markup:</p> <pre>&lt;div id'bar'&gt;</pre> <p>Due to a forgotten U+003D (=) code point between an attribute name and value the parser treats this markup as a <a href="#">div</a><sup>p256</sup> element with the attribute <code>"id'bar'"</code> that has an empty value.</p>
<b>unexpected-character-in-unquoted-attribute-value</b>	<p>This error occurs if the parser encounters a U+0022 ("), U+0027 ('), U+003C (&lt;), U+003D (=), or U+0060 (`) <a href="#">code point</a> in an unquoted <a href="#">attribute value</a><sup>p1262</sup>. The parser includes such code points in the attribute value.</p> <p><b>Note</b></p> <p>Code points that trigger this error are usually a part of another syntactic construct and can be a sign of a typo around the attribute value.</p> <p><b>Note</b></p> <p>U+0060 (`) is in the list of code points that trigger this error because certain legacy user agents treat it as a quote.</p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;div foo=b'ar'&gt;</pre> <p>Due to a misplaced U+0027 (') code point the parser sets the value of the <code>"foo"</code> attribute to <code>"b'ar'"</code>.</p>

Code	Description
<b>unexpected-equals-sign-before-attribute-name</b>	<p>This error occurs if the parser encounters a U+003D (=) <a href="#">code point</a> before an attribute name. In this case the parser treats U+003D (=) as the first code point of the attribute name.</p> <p><b>Note</b></p> <p><i>The common reason for this error is a forgotten attribute name.</i></p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;div foo="bar" ="baz"&gt;</pre> <p>Due to a forgotten attribute name the parser treats this markup as a <a href="#">div</a><sup>p256</sup> element with two attributes: a "foo" attribute with a "bar" value and a "baz" attribute with an empty value.</p>
<b>unexpected-null-character</b>	<p>This error occurs if the parser encounters a U+0000 NULL <a href="#">code point</a> in the <a href="#">input stream</a><sup>p1284</sup> in certain positions. In general, such code points are either ignored or, for security reasons, replaced with a U+FFFD REPLACEMENT CHARACTER.</p>
<b>unexpected-question-mark-instead-of-tag-name</b>	<p>This error occurs if the parser encounters a U+003F (?) <a href="#">code point</a> where first code point of a <a href="#">start tag</a><sup>p1261</sup> name is expected. The U+003F (?) and all content that follows up to a U+003E (&gt;) code point (if present) or to the end of the <a href="#">input stream</a><sup>p1284</sup> is treated as a comment.</p> <p><b>Example</b></p> <p>For example, consider the following markup:</p> <pre>&lt;?xml-stylesheet type="text/css" href="style.css"?&gt;</pre> <p>This will be parsed into:</p> <pre> #comment: ?xml-stylesheet type="text/css" href="style.css"? html<sup>p172</sup> ├ head<sup>p173</sup> │   └ body<sup>p205</sup> </pre> <p><b>Note</b></p> <p><i>The common reason for this error is an XML processing instruction (e.g., &lt;?xml-stylesheet type="text/css" href="style.css"?&gt;) or an XML declaration (e.g., &lt;?xml version="1.0" encoding="UTF-8"?&gt;) being used in HTML.</i></p>
<b>unexpected-solidus-in-tag</b>	<p>This error occurs if the parser encounters a U+002F (/) <a href="#">code point</a> that is not a part of a quoted <a href="#">attribute</a><sup>p1262</sup> value and not immediately followed by a U+003E (&gt;) code point in a tag (e.g., &lt;div / id="foo"&gt;). In this case the parser behaves as if it encountered <a href="#">ASCII whitespace</a>.</p>
<b>unknown-named-character-reference</b>	<p>This error occurs if the parser encounters an <a href="#">ambiguous ampersand</a><sup>p1270</sup>. In this case the parser doesn't resolve the <a href="#">character reference</a><sup>p1269</sup>.</p>

### 13.2.3 The input byte stream <sup>p12</sup><sub>77</sub>

The stream of code points that comprises the input to the tokenization stage will be initially seen by the user agent as a stream of bytes (typically coming over the network or from the local file system). The bytes encode the actual characters according to a particular *character encoding*, which the user agent uses to decode the bytes into characters.

**Note**

*For XML documents, the algorithm user agents are required to use to determine the character encoding is given by XML. This section does not apply to XML documents. [\[XML\]](#)<sup>p1484</sup>*

Usually, the [encoding sniffing algorithm](#)<sup>p1278</sup> defined below is used to determine the character encoding.

Given a character encoding, the bytes in the [input byte stream](#)<sup>p1277</sup> must be converted to characters for the tokenizer's [input stream](#)<sup>p1284</sup>, by passing the [input byte stream](#)<sup>p1277</sup> and character encoding to [decode](#).

**Note**

*A leading Byte Order Mark (BOM) causes the character encoding argument to be ignored and will itself be skipped.*

#### Note

Bytes or sequences of bytes in the original byte stream that did not conform to the Encoding standard (e.g. invalid UTF-8 byte sequences in a UTF-8 input byte stream) are errors that conformance checkers are expected to report. [ENCODING]<sup>p1478</sup>

#### ⚠Warning!

**The decoder algorithms describe how to handle invalid input; for security reasons, it is imperative that those rules be followed precisely. Differences in how invalid byte sequences are handled can result in, amongst other problems, script injection vulnerabilities ("XSS").**

When the HTML parser is decoding an input byte stream, it uses a character encoding and a **confidence**. The confidence is either *tentative*, *certain*, or *irrelevant*. The encoding used, and whether the confidence in that encoding is *tentative* or *certain*, is [used during the parsing](#)<sup>p1328</sup> to determine whether to [change the encoding](#)<sup>p1284</sup>. If no encoding is necessary, e.g. because the parser is operating on a Unicode stream and doesn't have to use a character encoding at all, then the [confidence](#)<sup>p1278</sup> is *irrelevant*.

#### Note

Some algorithms feed the parser by directly adding characters to the [input stream](#)<sup>p1284</sup> rather than adding bytes to the [input byte stream](#)<sup>p1277</sup>.

### 13.2.3.1 Parsing with a known character encoding <sup>p1278</sup>

When the HTML parser is to operate on an input byte stream that has a **known definite encoding**, then the character encoding is that encoding and the [confidence](#)<sup>p1278</sup> is *certain*.

### 13.2.3.2 Determining the character encoding <sup>p1278</sup>

In some cases, it might be impractical to unambiguously determine the encoding before parsing the document. Because of this, this specification provides for a two-pass mechanism with an optional pre-scan. Implementations are allowed, as described below, to apply a simplified parsing algorithm to whatever bytes they have available before beginning to parse the document. Then, the real parser is started, using a tentative encoding derived from this pre-parse and other out-of-band metadata. If, while the document is being loaded, the user agent discovers a character encoding declaration that conflicts with this information, then the parser can get reinvoked to perform a parse of the document with the real encoding.

User agents must use the following algorithm, called the **encoding sniffing algorithm**, to determine the character encoding to use when decoding a document in the first pass. This algorithm takes as input any out-of-band metadata available to the user agent (e.g. the [Content-Type metadata](#)<sup>p98</sup> of the document) and all the bytes available so far, and returns a character encoding and a [confidence](#)<sup>p1278</sup> that is either *tentative* or *certain*.

1. If the result of [BOM sniffing](#) is an encoding, return that encoding with [confidence](#)<sup>p1278</sup> *certain*.

#### Note

Although the [decode](#) algorithm will itself change the encoding to use based on the presence of a byte order mark, this algorithm sniffs the BOM as well in order to set the correct [document's character encoding](#) and [confidence](#)<sup>p1278</sup>.

2. If the user has explicitly instructed the user agent to override the document's character encoding with a specific encoding, optionally return that encoding with the [confidence](#)<sup>p1278</sup> *certain*.

#### Note

Typically, user agents remember such user requests across sessions, and in some cases apply them to documents in [iframe](#)<sup>p398</sup>s as well.

3. The user agent may wait for more bytes of the resource to be available, either in this step or at any later step in this algorithm. For instance, a user agent might wait 500ms or 1024 bytes, whichever came first. In general preparing the source to find the encoding improves performance, as it reduces the need to throw away the data structures used when parsing upon finding the encoding information. However, if the user agent delays too long to obtain data to determine the encoding, then the cost of the delay could outweigh any performance improvements from the preparse.

#### Note

The authoring conformance requirements for character encoding declarations limit them to only appearing [in the first 1024 bytes](#)<sup>p199</sup>. User agents are therefore encouraged to use the prescan algorithm below (as invoked by these steps) on the first 1024 bytes, but not to stall beyond that.

4. If the transport layer specifies a character encoding, and it is supported, return that encoding with the [confidence](#)<sup>p1278</sup> *certain*.
5. Optionally [prescan the byte stream to determine its encoding](#)<sup>p1280</sup>, with the [end condition](#)<sup>p1280</sup> being when the user agent decides that scanning further bytes would not be efficient. User agents are encouraged to only prescan the first 1024 bytes. User agents may decide that scanning *any* bytes is not efficient, in which case these substeps are entirely skipped.

The aforementioned algorithm returns either a character encoding or failure. If it returns a character encoding, then return the same encoding, with [confidence](#)<sup>p1278</sup> *tentative*.

6. If the [HTML parser](#)<sup>p1271</sup> for which this algorithm is being run is associated with a [Document](#)<sup>p130</sup> *d* whose [container document](#)<sup>p992</sup> is non-null, then:
  1. Let *parentDocument* be *d*'s [container document](#)<sup>p992</sup>.
  2. If *parentDocument*'s [origin](#) is [same origin](#)<sup>p899</sup> with *d*'s [origin](#) and *parentDocument*'s [character encoding](#) is not [UTF-16BE/LE](#), then return *parentDocument*'s [character encoding](#), with the [confidence](#)<sup>p1278</sup> *tentative*.
7. Otherwise, if the user agent has information on the likely encoding for this page, e.g. based on the encoding of the page when it was last visited, then return that encoding, with the [confidence](#)<sup>p1278</sup> *tentative*.
8. The user agent may attempt to autodetect the character encoding from applying frequency analysis or other algorithms to the data stream. Such algorithms may use information about the resource other than the resource's contents, including the address of the resource. If autodetection succeeds in determining a character encoding, and that encoding is a supported encoding, then return that encoding, with the [confidence](#)<sup>p1278</sup> *tentative*. [\[UNIVCHARDET\]](#)<sup>p1483</sup>

#### Note

User agents are generally discouraged from attempting to autodetect encodings for resources obtained over the network, since doing so involves inherently non-interoperable heuristics. Attempting to detect encodings based on an HTML document's preamble is especially tricky since HTML markup typically uses only ASCII characters, and HTML documents tend to begin with a lot of markup rather than with text content.

#### Note

The UTF-8 encoding has a highly detectable bit pattern. Files from the local file system that contain bytes with values greater than 0x7F which match the UTF-8 pattern are very likely to be UTF-8, while documents with byte sequences that do not match it are very likely not. When a user agent can examine the whole file, rather than just the preamble, detecting for UTF-8 specifically can be especially effective. [\[PPUTF8\]](#)<sup>p1481</sup> [\[UTF8DET\]](#)<sup>p1483</sup>

9. Otherwise, return an [implementation-defined](#) or user-specified default character encoding, with the [confidence](#)<sup>p1278</sup> *tentative*.

In controlled environments or in environments where the encoding of documents can be prescribed (for example, for user agents intended for dedicated use in new networks), the comprehensive UTF-8 encoding is suggested.

In other environments, the default encoding is typically dependent on the user's locale (an approximation of the languages, and thus often encodings, of the pages that the user is likely to frequent). The following table gives suggested defaults based on the user's locale, for compatibility with legacy content. Locales are identified by BCP 47 language tags. [\[BCP47\]](#)<sup>p1475</sup> [\[ENCODING\]](#)<sup>p1478</sup>

Locale language		Suggested default encoding

All other locales		<a href="#">windows-1252</a>

The contents of this table are derived from the intersection of Windows, Chrome, and Firefox defaults.

The [document's character encoding](#) must immediately be set to the value returned from this algorithm, at the same time as the user agent uses the returned value to select the decoder to use for the input byte stream.

When an algorithm requires a user agent to **prescan a byte stream to determine its encoding**, given some defined **end condition**, then it must run the following steps. If at any point during these steps (including during instances of the [get an attribute](#)<sup>p1282</sup> algorithm invoked by this one) the user agent either runs out of bytes (meaning the *position* pointer created in the first step below goes beyond the end of the byte stream obtained so far) or reaches its *end condition*, then abort the [prescan a byte stream to determine its encoding](#)<sup>p1280</sup> algorithm and return the result [get an XML encoding](#)<sup>p1283</sup> applied to the same bytes that the [prescan a byte stream to determine its encoding](#)<sup>p1280</sup> algorithm was applied to. Otherwise, these steps will return a character encoding.

1. Let *fallback encoding* be null.
2. Let *position* be a pointer to a byte in the input byte stream, initially pointing at the first byte.
3. Prescan for UTF-16 XML declarations: If *position* points to:
  - ↪ **A sequence of bytes starting with: 0x3C, 0x0, 0x3F, 0x0, 0x78, 0x0 (case-sensitive UTF-16 little-endian '<?x')**  
Return [UTF-16LE](#).
  - ↪ **A sequence of bytes starting with: 0x0, 0x3C, 0x0, 0x3F, 0x0, 0x78 (case-sensitive UTF-16 big-endian '<?x')**  
Return [UTF-16BE](#).

#### Note

For historical reasons, the prefix is two bytes longer than in [Appendix F](#) of XML and the encoding name is not checked.

4. Loop: If *position* points to:
  - ↪ **A sequence of bytes starting with: 0x3C 0x21 0x2D 0x2D ('<!--')**  
Advance the *position* pointer so that it points at the first 0x3E byte which is preceded by two 0x2D bytes (i.e. at the end of an ASCII '-->' sequence) and comes after the 0x3C byte that was found. (The two 0x2D bytes can be the same

as those in the '<!--' sequence.)

↪ **A sequence of bytes starting with: 0x3C, 0x4D or 0x6D, 0x45 or 0x65, 0x54 or 0x74, 0x41 or 0x61, and one of 0x09, 0x0A, 0x0C, 0x0D, 0x20, 0x2F (case-insensitive ASCII '<meta' followed by a space or slash)**

1. Advance the *position* pointer so that it points at the next 0x09, 0x0A, 0x0C, 0x0D, 0x20, or 0x2F byte (the one in sequence of characters matched above).
2. Let *attribute list* be an empty list of strings.
3. Let *got pragma* be false.
4. Let *need pragma* be null.
5. Let *charset* be the null value (which, for the purposes of this algorithm, is distinct from an unrecognized encoding or the empty string).
6. *Attributes*: [Get an attribute](#)<sup>p1282</sup> and its value. If no attribute was sniffed, then jump to the *processing* step below.
7. If the attribute's name is already in *attribute list*, then return to the step labeled *attributes*.
8. Add the attribute's name to *attribute list*.
9. Run the appropriate step from the following list, if one applies:
  - ↪ **If the attribute's name is "http-equiv"**  
If the attribute's value is "content-type", then set *got pragma* to true.
  - ↪ **If the attribute's name is "content"**  
Apply the [algorithm for extracting a character encoding from a meta element](#)<sup>p99</sup>, giving the attribute's value as the string to parse. If a character encoding is returned, and if *charset* is still set to null, let *charset* be the encoding returned, and set *need pragma* to true.
  - ↪ **If the attribute's name is "charset"**  
Let *charset* be the result of [getting an encoding](#) from the attribute's value, and set *need pragma* to false.
10. Return to the step labeled *attributes*.
11. *Processing*: If *need pragma* is null, then jump to the step below labeled *next byte*.
12. If *need pragma* is true but *got pragma* is false, then jump to the step below labeled *next byte*.
13. If *charset* is failure, then jump to the step below labeled *next byte*.
14. If *charset* is [UTF-16BE/LE](#), then set *charset* to [UTF-8](#).
15. If *charset* is [x-user-defined](#), then set *charset* to [windows-1252](#).
16. Return *charset*.

↪ **A sequence of bytes starting with a 0x3C byte (<), optionally a 0x2F byte (/), and finally a byte in the range 0x41-0x5A or 0x61-0x7A (A-Z or a-z)**

1. Advance the *position* pointer so that it points at the next 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x3E (>) byte.
2. Repeatedly [get an attribute](#)<sup>p1282</sup> until no further attributes can be found, then jump to the step below labeled *next byte*.

↪ **A sequence of bytes starting with: 0x3C 0x21 (`<!`)**

↪ **A sequence of bytes starting with: 0x3C 0x2F (`</`)**

↪ **A sequence of bytes starting with: 0x3C 0x3F (`<?`)**

Advance the *position* pointer so that it points at the first 0x3E byte (>) that comes after the 0x3C byte that was found.

↪ **Any other byte**

Do nothing with that byte.

5. *Next byte*: Move *position* so it points at the next byte in the input byte stream, and return to the step above labeled *loop*.

When the [prescan a byte stream to determine its encoding<sup>p1280</sup>](#) algorithm says to **get an attribute**, it means doing this:

1. If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x2F (/) then advance *position* to the next byte and redo this step.
2. If the byte at *position* is 0x3E (>), then abort the [get an attribute<sup>p1282</sup>](#) algorithm. There isn't one.
3. Otherwise, the byte at *position* is the start of the attribute name. Let *attribute name* and *attribute value* be the empty string.
4. Process the byte at *position* as follows:
  - ↪ **If it is 0x3D (=), and the attribute name is longer than the empty string**  
Advance *position* to the next byte and jump to the step below labeled *value*.
  - ↪ **If it is 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP)**  
Jump to the step below labeled *spaces*.
  - ↪ **If it is 0x2F (/) or 0x3E (>)**  
Abort the [get an attribute<sup>p1282</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
  - ↪ **If it is in the range 0x41 (A) to 0x5A (Z)**  
Append the code point  $b+0x20$  to *attribute name* (where  $b$  is the value of the byte at *position*). (This converts the input to lowercase.)
  - ↪ **Anything else**  
Append the code point with the same value as the byte at *position* to *attribute name*. (It doesn't actually matter how bytes outside the ASCII range are handled here, since only ASCII bytes can contribute to the detection of a character encoding.)
5. Advance *position* to the next byte and return to the previous step.
6. *Spaces*: If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP) then advance *position* to the next byte, then, repeat this step.
7. If the byte at *position* is *not* 0x3D (=), abort the [get an attribute<sup>p1282</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.
8. Advance *position* past the 0x3D (=) byte.
9. *Value*: If the byte at *position* is one of 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), or 0x20 (SP) then advance *position* to the next byte, then, repeat this step.
10. Process the byte at *position* as follows:
  - ↪ **If it is 0x22 (") or 0x27 (')**
    1. Let  $b$  be the value of the byte at *position*.
    2. *Quote loop*: Advance *position* to the next byte.
    3. If the value of the byte at *position* is the value of  $b$ , then advance *position* to the next byte and abort the "get an attribute" algorithm. The attribute's name is the value of *attribute name*, and its value is the value of *attribute value*.
    4. Otherwise, if the value of the byte at *position* is in the range 0x41 (A) to 0x5A (Z), then append a code point to *attribute value* whose value is 0x20 more than the value of the byte at *position*.
    5. Otherwise, append a code point to *attribute value* whose value is the same as the value of the byte at *position*.
    6. Return to the step above labeled *quote loop*.
  - ↪ **If it is 0x3E (>)**  
Abort the [get an attribute<sup>p1282</sup>](#) algorithm. The attribute's name is the value of *attribute name*, its value is the empty string.

↪ **If it is in the range 0x41 (A) to 0x5A (Z)**

Append a code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*). Advance *position* to the next byte.

↪ **Anything else**

Append a code point with the same value as the byte at *position* to *attribute value*. Advance *position* to the next byte.

11. Process the byte at *position* as follows:

↪ **If it is 0x09 (HT), 0x0A (LF), 0x0C (FF), 0x0D (CR), 0x20 (SP), or 0x3E (>)**

Abort the [get an attribute](#)<sup>p1282</sup> algorithm. The attribute's name is the value of *attribute name* and its value is the value of *attribute value*.

↪ **If it is in the range 0x41 (A) to 0x5A (Z)**

Append a code point  $b+0x20$  to *attribute value* (where  $b$  is the value of the byte at *position*).

↪ **Anything else**

Append a code point with the same value as the byte at *position* to *attribute value*.

12. Advance *position* to the next byte and return to the previous step.

When the [prescan a byte stream to determine its encoding](#)<sup>p1280</sup> algorithm is aborted without returning an encoding, **get an XML encoding** means doing this.

**Note**

Looking for syntax resembling an XML declaration, even in [text/html](#)<sup>p1444</sup>, is necessary for compatibility with existing content.

1. Let *encodingPosition* be a pointer to the start of the stream.
2. If *encodingPosition* does not point to the start of a byte sequence 0x3C, 0x3F, 0x78, 0x6D, 0x6C (`<?xml``), then return failure.
3. Let *xmlDeclarationEnd* be a pointer to the next byte in the input byte stream which is 0x3E (>). If there is no such byte, then return failure.
4. Set *encodingPosition* to the position of the first occurrence of the subsequence of bytes 0x65, 0x6E, 0x63, 0x6F, 0x64, 0x69, 0x6E, 0x67 (``encoding``) at or after the current *encodingPosition*. If there is no such sequence, then return failure.
5. Advance *encodingPosition* past the 0x67 (g) byte.
6. While the byte at *encodingPosition* is less than or equal to 0x20 (i.e., it is either an ASCII space or control character), advance *encodingPosition* to the next byte.
7. If the byte at *encodingPosition* is not 0x3D (=), then return failure.
8. Advance *encodingPosition* to the next byte.
9. While the byte at *encodingPosition* is less than or equal to 0x20 (i.e., it is either an ASCII space or control character), advance *encodingPosition* to the next byte.
10. Let *quoteMark* be the byte at *encodingPosition*.
11. If *quoteMark* is not either 0x22 (") or 0x27 ('), then return failure.
12. Advance *encodingPosition* to the next byte.
13. Let *encodingEndPosition* be the position of the next occurrence of *quoteMark* at or after *encodingPosition*. If *quoteMark* does not occur again, then return failure.
14. Let *potentialEncoding* be the sequence of the bytes between *encodingPosition* (inclusive) and *encodingEndPosition* (exclusive).
15. If *potentialEncoding* contains one or more bytes whose byte value is 0x20 or below, then return failure.
16. Let *encoding* be the result of [getting an encoding](#) given *potentialEncoding* [isomorphic decoded](#).
17. If the *encoding* is [UTF-16BE/LE](#), then change it to [UTF-8](#).
18. Return *encoding*.

For the sake of interoperability, user agents should not use a pre-scan algorithm that returns different results than the one described above. (But, if you do, please at least let us know, so that we can improve this algorithm and benefit everyone...)

### 13.2.3.3 Character encodings §<sup>p12</sup><sub>84</sub>

User agents must support the encodings defined in *Encoding*, including, but not limited to, [UTF-8](#), [ISO-8859-2](#), [ISO-8859-7](#), [ISO-8859-8](#), [windows-874](#), [windows-1250](#), [windows-1251](#), [windows-1252](#), [windows-1254](#), [windows-1255](#), [windows-1256](#), [windows-1257](#), [windows-1258](#), [GBK](#), [Big5](#), [ISO-2022-JP](#), [Shift\\_JIS](#), [EUC-KR](#), [UTF-16BE](#), [UTF-16LE](#), [UTF-16BE/LE](#), and [x-user-defined](#). User agents must not support other encodings.

#### Note

*The above prohibits supporting, for example, CESU-8, UTF-7, BOCU-1, SCSU, EBCDIC, and UTF-32. This specification does not make any attempt to support prohibited encodings in its algorithms; support and use of prohibited encodings would thus lead to unexpected behavior. [\[CESU8\]](#)<sup>p1475</sup> [\[UTF7\]](#)<sup>p1483</sup> [\[BOCU1\]](#)<sup>p1475</sup> [\[SCSU\]](#)<sup>p1482</sup>*

### 13.2.3.4 Changing the encoding while parsing §<sup>p12</sup><sub>84</sub>

When the parser requires the user agent to **change the encoding**, it must run the following steps. This might happen if the [encoding sniffing algorithm](#)<sup>p1278</sup> described above failed to find a character encoding, or if it found a character encoding that was not the actual encoding of the file.

1. If the encoding that is already being used to interpret the input stream is [UTF-16BE/LE](#), then set the [confidence](#)<sup>p1278</sup> to *certain* and return. The new encoding is ignored; if it was anything but the same encoding, then it would be clearly incorrect.
2. If the new encoding is [UTF-16BE/LE](#), then change it to [UTF-8](#).
3. If the new encoding is [x-user-defined](#), then change it to [windows-1252](#).
4. If the new encoding is identical or equivalent to the encoding that is already being used to interpret the input stream, then set the [confidence](#)<sup>p1278</sup> to *certain* and return. This happens when the encoding information found in the file matches what the [encoding sniffing algorithm](#)<sup>p1278</sup> determined to be the encoding, and in the second pass through the parser if the first pass found that the encoding sniffing algorithm described in the earlier section failed to find the right encoding.
5. If all the bytes up to the last byte converted by the current decoder have the same Unicode interpretations in both the current encoding and the new encoding, and if the user agent supports changing the converter on the fly, then the user agent may change to the new converter for the encoding on the fly. Set the [document's character encoding](#) and the encoding used to convert the input stream to the new encoding, set the [confidence](#)<sup>p1278</sup> to *certain*, and return.
6. Otherwise, restart the [navigate](#)<sup>p1014</sup> algorithm, with [historyHandling](#)<sup>p1014</sup> set to "[replace](#)<sup>p1014</sup>" and other inputs kept the same, but this time skip the [encoding sniffing algorithm](#)<sup>p1278</sup> and instead just set the encoding to the new encoding and the [confidence](#)<sup>p1278</sup> to *certain*. Whenever possible, this should be done without actually contacting the network layer (the bytes should be re-parsed from memory), even if, e.g., the document is marked as not being cacheable. If this is not possible and contacting the network layer would involve repeating a request that uses a method other than ``GET``, then instead set the [confidence](#)<sup>p1278</sup> to *certain* and ignore the new encoding. The resource will be misinterpreted. User agents may notify the user of the situation, to aid in application development.

#### Note

*This algorithm is only invoked when a new encoding is found declared on a [meta](#)<sup>p189</sup> element.*

### 13.2.3.5 Preprocessing the input stream §<sup>p12</sup><sub>84</sub>

The **input stream** consists of the characters pushed into it as the [input byte stream](#)<sup>p1277</sup> is decoded or from the various APIs that directly manipulate the input stream.

Any occurrences of [surrogates](#) are [surrogate-in-input-stream](#)<sup>p1276</sup> [parse errors](#)<sup>p1273</sup>. Any occurrences of [noncharacters](#) are [noncharacter-in-input-stream](#)<sup>p1275</sup> [parse errors](#)<sup>p1273</sup> and any occurrences of [controls](#) other than [ASCII whitespace](#) and U+0000 NULL characters are [control-character-in-input-stream](#)<sup>p1273</sup> [parse errors](#)<sup>p1273</sup>.

## Note

The handling of U+0000 NULL characters varies based on where the characters are found and happens at the later stages of the parsing. They are either ignored or, for security reasons, replaced with a U+FFFD REPLACEMENT CHARACTER. This handling is, by necessity, spread across both the tokenization stage and the tree construction stage.

Before the [tokenization](#)<sup>p1290</sup> stage, the input stream must be preprocessed by [normalizing newlines](#). Thus, newlines in HTML DOMs are represented by U+000A LF characters, and there are never any U+000D CR characters in the input to the [tokenization](#)<sup>p1290</sup> stage.

The **next input character** is the first character in the [input stream](#)<sup>p1284</sup> that has not yet been **consumed** or explicitly ignored by the requirements in this section. Initially, the [next input character](#)<sup>p1285</sup> is the first character in the input. The **current input character** is the last character to have been *consumed*.

The **insertion point** is the position (just before a character or just before the end of the input stream) where content inserted using [document.write\(\)](#)<sup>p1153</sup> is actually inserted. The insertion point is relative to the position of the character immediately after it, it is not an absolute offset into the input stream. Initially, the insertion point is undefined.

The "EOF" character in the tables below is a conceptual character representing the end of the [input stream](#)<sup>p1284</sup>. If the parser is a [script-created parser](#)<sup>p1151</sup>, then the end of the [input stream](#)<sup>p1284</sup> is reached when an **explicit "EOF" character** (inserted by the [document.close\(\)](#)<sup>p1152</sup> method) is consumed. Otherwise, the "EOF" character is not a real character in the stream, but rather the lack of any further characters.

### 13.2.4 Parse state <sup>§ p1285</sup>

#### 13.2.4.1 The insertion mode <sup>§ p1285</sup>

The **insertion mode** is a state variable that controls the primary operation of the tree construction stage.

Initially, the [insertion mode](#)<sup>p1285</sup> is "[initial](#)<sup>p1325</sup>". It can change to "[before html](#)<sup>p1326</sup>", "[before head](#)<sup>p1327</sup>", "[in head](#)<sup>p1328</sup>", "[in head noscript](#)<sup>p1330</sup>", "[after head](#)<sup>p1331</sup>", "[in body](#)<sup>p1332</sup>", "[text](#)<sup>p1342</sup>", "[in table](#)<sup>p1343</sup>", "[in table text](#)<sup>p1345</sup>", "[in caption](#)<sup>p1346</sup>", "[in column group](#)<sup>p1346</sup>", "[in table body](#)<sup>p1347</sup>", "[in row](#)<sup>p1348</sup>", "[in cell](#)<sup>p1349</sup>", "[in select](#)<sup>p1350</sup>", "[in select in table](#)<sup>p1352</sup>", "[in template](#)<sup>p1352</sup>", "[after body](#)<sup>p1353</sup>", "[in frameset](#)<sup>p1354</sup>", "[after frameset](#)<sup>p1355</sup>", "[after after body](#)<sup>p1355</sup>", and "[after after frameset](#)<sup>p1355</sup>" during the course of the parsing, as described in the [tree construction](#)<sup>p1318</sup> stage. The insertion mode affects how tokens are processed and whether CDATA sections are supported.

Several of these modes, namely "[in head](#)<sup>p1328</sup>", "[in body](#)<sup>p1332</sup>", "[in table](#)<sup>p1343</sup>", and "[in select](#)<sup>p1350</sup>", are special, in that the other modes defer to them at various times. When the algorithm below says that the user agent is to do something "**using the rules for the *m* insertion mode**", where *m* is one of these modes, the user agent must use the rules described under the *m* [insertion mode](#)<sup>p1285</sup>'s section, but must leave the [insertion mode](#)<sup>p1285</sup> unchanged unless the rules in *m* themselves switch the [insertion mode](#)<sup>p1285</sup> to a new value.

When the insertion mode is switched to "[text](#)<sup>p1342</sup>" or "[in table text](#)<sup>p1345</sup>", the **original insertion mode** is also set. This is the insertion mode to which the tree construction stage will return.

Similarly, to parse nested [template](#)<sup>p671</sup> elements, a **stack of template insertion modes** is used. It is initially empty. The **current template insertion mode** is the insertion mode that was most recently added to the [stack of template insertion modes](#)<sup>p1285</sup>. The algorithms in the sections below will *push* insertion modes onto this stack, meaning that the specified insertion mode is to be added to the stack, and *pop* insertion modes from the stack, which means that the most recently added insertion mode must be removed from the stack.

When the steps below require the UA to **reset the insertion mode appropriately**, it means the UA must follow these steps:

1. Let *last* be false.
2. Let *node* be the last node in the [stack of open elements](#)<sup>p1286</sup>.
3. *Loop*: If *node* is the first node in the stack of open elements, then set *last* to true, and, if the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup> ([fragment case](#)<sup>p1373</sup>), set *node* to the [context](#)<sup>p1373</sup> element passed to that algorithm.
4. If *node* is a [select](#)<sup>p568</sup> element, run these substeps:

1. If *last* is true, jump to the step below labeled *done*.
  2. Let *ancestor* be *node*.
  3. *Loop*: If *ancestor* is the first node in the [stack of open elements](#)<sup>p1286</sup>, jump to the step below labeled *done*.
  4. Let *ancestor* be the node before *ancestor* in the [stack of open elements](#)<sup>p1286</sup>.
  5. If *ancestor* is a [template](#)<sup>p671</sup> node, jump to the step below labeled *done*.
  6. If *ancestor* is a [table](#)<sup>p478</sup> node, switch the [insertion mode](#)<sup>p1285</sup> to "[in select in table](#)<sup>p1352</sup>" and return.
  7. Jump back to the step labeled *loop*.
  8. *Done*: Switch the [insertion mode](#)<sup>p1285</sup> to "[in select](#)<sup>p1350</sup>" and return.
5. If *node* is a [td](#)<sup>p493</sup> or [th](#)<sup>p495</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p1285</sup> to "[in cell](#)<sup>p1349</sup>" and return.
  6. If *node* is a [tr](#)<sup>p492</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in row](#)<sup>p1348</sup>" and return.
  7. If *node* is a [tbody](#)<sup>p489</sup>, [thead](#)<sup>p490</sup>, or [tfoot](#)<sup>p491</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in table body](#)<sup>p1347</sup>" and return.
  8. If *node* is a [caption](#)<sup>p486</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in caption](#)<sup>p1346</sup>" and return.
  9. If *node* is a [colgroup](#)<sup>p487</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in column group](#)<sup>p1346</sup>" and return.
  10. If *node* is a [table](#)<sup>p478</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>" and return.
  11. If *node* is a [template](#)<sup>p671</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to the [current template insertion mode](#)<sup>p1285</sup> and return.
  12. If *node* is a [head](#)<sup>p173</sup> element and *last* is false, then switch the [insertion mode](#)<sup>p1285</sup> to "[in head](#)<sup>p1328</sup>" and return.
  13. If *node* is a [body](#)<sup>p205</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>" and return.
  14. If *node* is a [frameset](#)<sup>p1433</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[in frameset](#)<sup>p1354</sup>" and return. ([fragment case](#)<sup>p1373</sup>)
  15. If *node* is an [html](#)<sup>p172</sup> element, run these substeps:
    1. If the [head element pointer](#)<sup>p1289</sup> is null, switch the [insertion mode](#)<sup>p1285</sup> to "[before head](#)<sup>p1327</sup>" and return. ([fragment case](#)<sup>p1373</sup>)
    2. Otherwise, the [head element pointer](#)<sup>p1289</sup> is not null, switch the [insertion mode](#)<sup>p1285</sup> to "[after head](#)<sup>p1331</sup>" and return.
  16. If *last* is true, then switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>" and return. ([fragment case](#)<sup>p1373</sup>)
  17. Let *node* now be the node before *node* in the [stack of open elements](#)<sup>p1286</sup>.
  18. Return to the step labeled *loop*.

#### 13.2.4.2 The stack of open elements <sup>p1286</sup>

Initially, the **stack of open elements** is empty. The stack grows downwards; the topmost node on the stack is the first one added to the stack, and the bottommost node of the stack is the most recently added node in the stack (notwithstanding when the stack is manipulated in a random access fashion as part of [the handling for misnested tags](#)<sup>p1340</sup>).

##### Note

The "[before html](#)<sup>p1326</sup>" [insertion mode](#)<sup>p1285</sup> creates the [html](#)<sup>p172</sup> document element, which is then added to the stack.

##### Note

In the [fragment case](#)<sup>p1373</sup>, the [stack of open elements](#)<sup>p1286</sup> is initialized to contain an [html](#)<sup>p172</sup> element that is created as part of [that algorithm](#)<sup>p1373</sup>. (The [fragment case](#)<sup>p1373</sup> skips the "[before html](#)<sup>p1326</sup>" [insertion mode](#)<sup>p1285</sup>.)

The [html](#)<sup>p172</sup> node, however it is created, is the topmost node of the stack. It only gets popped off the stack when the parser [finishes](#)<sup>p1358</sup>.

The **current node** is the bottommost node in this [stack of open elements](#)<sup>p1286</sup>.

The **adjusted current node** is the [context](#)<sup>p1373</sup> element if the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup> and the [stack of open elements](#)<sup>p1286</sup> has only one element in it ([fragment case](#)<sup>p1373</sup>); otherwise, the [adjusted current node](#)<sup>p1287</sup> is the [current node](#)<sup>p1286</sup>.

When the [current node](#)<sup>p1286</sup> is removed from the [stack of open elements](#)<sup>p1286</sup>, [process internal resource links](#)<sup>p319</sup> given the [current node](#)<sup>p1286</sup>'s [node document](#).

Elements in the [stack of open elements](#)<sup>p1286</sup> fall into the following categories:

### Special

The following elements have varying levels of special parsing rules: HTML's [address](#)<sup>p222</sup>, [applet](#)<sup>p1426</sup>, [area](#)<sup>p471</sup>, [article](#)<sup>p206</sup>, [aside](#)<sup>p214</sup>, [base](#)<sup>p175</sup>, [basefont](#)<sup>p1427</sup>, [bg sound](#)<sup>p1426</sup>, [blockquote](#)<sup>p235</sup>, [body](#)<sup>p205</sup>, [br](#)<sup>p299</sup>, [button](#)<sup>p566</sup>, [caption](#)<sup>p486</sup>, [center](#)<sup>p1427</sup>, [col](#)<sup>p488</sup>, [colgroup](#)<sup>p487</sup>, [dd](#)<sup>p248</sup>, [details](#)<sup>p637</sup>, [dir](#)<sup>p1426</sup>, [div](#)<sup>p256</sup>, [dl](#)<sup>p244</sup>, [dt](#)<sup>p247</sup>, [embed](#)<sup>p399</sup>, [fieldset](#)<sup>p594</sup>, [figcaption](#)<sup>p252</sup>, [figure](#)<sup>p249</sup>, [footer](#)<sup>p220</sup>, [form](#)<sup>p514</sup>, [frame](#)<sup>p1433</sup>, [frameset](#)<sup>p1433</sup>, [h1](#)<sup>p216</sup>, [h2](#)<sup>p216</sup>, [h3](#)<sup>p216</sup>, [h4](#)<sup>p216</sup>, [h5](#)<sup>p216</sup>, [h6](#)<sup>p216</sup>, [head](#)<sup>p173</sup>, [header](#)<sup>p218</sup>, [hgroup](#)<sup>p218</sup>, [hr](#)<sup>p231</sup>, [html](#)<sup>p172</sup>, [iframe](#)<sup>p390</sup>, [img](#)<sup>p346</sup>, [input](#)<sup>p520</sup>, [keygen](#)<sup>p1426</sup>, [li](#)<sup>p241</sup>, [link](#)<sup>p177</sup>, [listing](#)<sup>p1426</sup>, [main](#)<sup>p253</sup>, [marquee](#)<sup>p1431</sup>, [menu](#)<sup>p240</sup>, [meta](#)<sup>p189</sup>, [nav](#)<sup>p211</sup>, [noembed](#)<sup>p1426</sup>, [noframes](#)<sup>p1426</sup>, [noscript](#)<sup>p669</sup>, [object](#)<sup>p402</sup>, [ol](#)<sup>p238</sup>, [p](#)<sup>p229</sup>, [param](#)<sup>p1426</sup>, [plaintext](#)<sup>p1426</sup>, [pre](#)<sup>p233</sup>, [script](#)<sup>p652</sup>, [search](#)<sup>p254</sup>, [section](#)<sup>p209</sup>, [select](#)<sup>p568</sup>, [source](#)<sup>p343</sup>, [style](#)<sup>p200</sup>, [summary](#)<sup>p643</sup>, [table](#)<sup>p478</sup>, [tbody](#)<sup>p489</sup>, [td](#)<sup>p493</sup>, [template](#)<sup>p671</sup>, [textarea](#)<sup>p579</sup>, [tfoot](#)<sup>p491</sup>, [th](#)<sup>p495</sup>, [thead](#)<sup>p490</sup>, [title](#)<sup>p174</sup>, [tr](#)<sup>p492</sup>, [track](#)<sup>p411</sup>, [ul](#)<sup>p239</sup>, [wbr](#)<sup>p300</sup>, [xmp](#)<sup>p1427</sup>; [MathML mi](#), [MathML mo](#), [MathML mn](#), [MathML ms](#), [MathML mtext](#), and [MathML annotation-xml](#); and [SVG foreignObject](#), [SVG desc](#), and [SVG title](#).

#### Note

An image *start tag token* is handled by the tree builder, but it is not in this list because it is not an element; it gets turned into an [img](#)<sup>p346</sup> element.

### Formatting

The following HTML elements are those that end up in the [list of active formatting elements](#)<sup>p1288</sup>: [a](#)<sup>p257</sup>, [b](#)<sup>p292</sup>, [big](#)<sup>p1427</sup>, [code](#)<sup>p286</sup>, [em](#)<sup>p260</sup>, [font](#)<sup>p1427</sup>, [i](#)<sup>p291</sup>, [nobr](#)<sup>p1427</sup>, [s](#)<sup>p264</sup>, [small](#)<sup>p262</sup>, [strike](#)<sup>p1427</sup>, [strong](#)<sup>p261</sup>, [tt](#)<sup>p1427</sup>, and [u](#)<sup>p294</sup>.

### Ordinary

All other elements found while parsing an HTML document.

#### Note

Typically, the [special](#)<sup>p1287</sup> elements have the start and end tag tokens handled specifically, while [ordinary](#)<sup>p1287</sup> elements' tokens fall into "any other start tag" and "any other end tag" clauses, and some parts of the tree builder check if a particular element in the [stack of open elements](#)<sup>p1286</sup> is in the [special](#)<sup>p1287</sup> category. However, some elements (e.g., the [option](#)<sup>p577</sup> element) have their start or end tag tokens handled specifically, but are still not in the [special](#)<sup>p1287</sup> category, so that they get the [ordinary](#)<sup>p1287</sup> handling elsewhere.

The [stack of open elements](#)<sup>p1286</sup> is said to **have an element target node in a specific scope** consisting of a list of element types *list* when the following algorithm terminates in a match state:

1. Initialize *node* to be the [current node](#)<sup>p1286</sup> (the bottommost node of the stack).
2. If *node* is the target node, terminate in a match state.
3. Otherwise, if *node* is one of the element types in *list*, terminate in a failure state.
4. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p1286</sup> and return to step 2. (This will never fail, since the loop will always terminate in the previous step if the top of the stack — an [html](#)<sup>p172</sup> element — is reached.)

The [stack of open elements](#)<sup>p1286</sup> is said to **have a particular element in scope** when it [has that element in the specific scope](#)<sup>p1287</sup> consisting of the following element types:

- [applet](#)<sup>p1426</sup>
- [caption](#)<sup>p486</sup>
- [html](#)<sup>p172</sup>
- [table](#)<sup>p478</sup>
- [td](#)<sup>p493</sup>
- [th](#)<sup>p495</sup>
- [marquee](#)<sup>p1431</sup>
- [object](#)<sup>p402</sup>
- [template](#)<sup>p671</sup>
- [MathML mi](#)
- [MathML mo](#)

- [MathML<sub>mn</sub>](#)
- [MathML<sub>ms</sub>](#)
- [MathML<sub>mtext</sub>](#)
- [MathML<sub>annotation-xml</sub>](#)
- [SVG<sub>foreignObject</sub>](#)
- [SVG<sub>desc</sub>](#)
- [SVG<sub>title</sub>](#)

The [stack of open elements](#)<sup>p1286</sup> is said to **have a particular element in list item scope** when it [has that element in the specific scope](#)<sup>p1287</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p1287</sup> algorithm.
- [ol](#)<sup>p238</sup> in the [HTML namespace](#)
- [ul](#)<sup>p239</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1286</sup> is said to **have a particular element in button scope** when it [has that element in the specific scope](#)<sup>p1287</sup> consisting of the following element types:

- All the element types listed above for the [has an element in scope](#)<sup>p1287</sup> algorithm.
- [button](#)<sup>p566</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1286</sup> is said to **have a particular element in table scope** when it [has that element in the specific scope](#)<sup>p1287</sup> consisting of the following element types:

- [html](#)<sup>p172</sup> in the [HTML namespace](#)
- [table](#)<sup>p478</sup> in the [HTML namespace](#)
- [template](#)<sup>p671</sup> in the [HTML namespace](#)

The [stack of open elements](#)<sup>p1286</sup> is said to **have a particular element in select scope** when it [has that element in the specific scope](#)<sup>p1287</sup> consisting of all element types *except* the following:

- [optgroup](#)<sup>p576</sup> in the [HTML namespace](#)
- [option](#)<sup>p577</sup> in the [HTML namespace](#)

Nothing happens if at any time any of the elements in the [stack of open elements](#)<sup>p1286</sup> are moved to a new location in, or removed from, the [Document](#)<sup>p130</sup> tree. In particular, the stack is not changed in this situation. This can cause, amongst other strange effects, content to be appended to nodes that are no longer in the DOM.

#### Note

*In some cases (namely, when [closing misnested formatting elements](#)<sup>p1340</sup>), the stack is manipulated in a random-access fashion.*

### 13.2.4.3 The list of active formatting elements <sup>§<sup>p12</sup><sub>88</sub></sup>

Initially, the **list of active formatting elements** is empty. It is used to handle mis-nested [formatting element tags](#)<sup>p1287</sup>.

The list contains elements in the [formatting](#)<sup>p1287</sup> category, and [markers](#)<sup>p1288</sup>. The **markers** are inserted when entering [applet](#)<sup>p1426</sup>, [object](#)<sup>p402</sup>, [marquee](#)<sup>p1431</sup>, [template](#)<sup>p671</sup>, [td](#)<sup>p493</sup>, [th](#)<sup>p495</sup>, and [caption](#)<sup>p486</sup> elements, and are used to prevent formatting from "leaking" into [applet](#)<sup>p1426</sup>, [object](#)<sup>p402</sup>, [marquee](#)<sup>p1431</sup>, [template](#)<sup>p671</sup>, [td](#)<sup>p493</sup>, [th](#)<sup>p495</sup>, and [caption](#)<sup>p486</sup> elements.

In addition, each element in the [list of active formatting elements](#)<sup>p1288</sup> is associated with the token for which it was created, so that further elements can be created for that token if necessary.

When the steps below require the UA to **push onto the list of active formatting elements** an element *element*, the UA must perform the following steps:

1. If there are already three elements in the [list of active formatting elements](#)<sup>p1288</sup> after the last [marker](#)<sup>p1288</sup>, if any, or anywhere in the list if there are no [markers](#)<sup>p1288</sup>, that have the same tag name, namespace, and attributes as *element*, then remove the earliest such element from the [list of active formatting elements](#)<sup>p1288</sup>. For these purposes, the attributes must be compared as they were when the elements were created by the parser; two elements have the same attributes if all their parsed attributes can be paired such that the two attributes in each pair have identical names, namespaces, and values (the order of the attributes does not matter).

#### Note

*This is the Noah's Ark clause. But with three per family instead of two.*

2. Add *element* to the [list of active formatting elements](#)<sup>p1288</sup>.

When the steps below require the UA to **reconstruct the active formatting elements**, the UA must perform the following steps:

1. If there are no entries in the [list of active formatting elements](#)<sup>p1288</sup>, then there is nothing to reconstruct; stop this algorithm.
2. If the last (most recently added) entry in the [list of active formatting elements](#)<sup>p1288</sup> is a [marker](#)<sup>p1288</sup>, or if it is an element that is in the [stack of open elements](#)<sup>p1286</sup>, then there is nothing to reconstruct; stop this algorithm.
3. Let *entry* be the last (most recently added) element in the [list of active formatting elements](#)<sup>p1288</sup>.
4. *Rewind*: If there are no entries before *entry* in the [list of active formatting elements](#)<sup>p1288</sup>, then jump to the step labeled *create*.
5. Let *entry* be the entry one earlier than *entry* in the [list of active formatting elements](#)<sup>p1288</sup>.
6. If *entry* is neither a [marker](#)<sup>p1288</sup> nor an element that is also in the [stack of open elements](#)<sup>p1286</sup>, go to the step labeled *rewind*.
7. *Advance*: Let *entry* be the element one later than *entry* in the [list of active formatting elements](#)<sup>p1288</sup>.
8. *Create*: [Insert an HTML element](#)<sup>p1321</sup> for the token for which the element *entry* was created, to obtain *new element*.
9. Replace the entry for *entry* in the list with an entry for *new element*.
10. If the entry for *new element* in the [list of active formatting elements](#)<sup>p1288</sup> is not the last entry in the list, return to the step labeled *advance*.

This has the effect of reopening all the formatting elements that were opened in the current body, cell, or caption (whichever is youngest) that haven't been explicitly closed.

#### Note

*The way this specification is written, the [list of active formatting elements](#)<sup>p1288</sup> always consists of elements in chronological order with the least recently added element first and the most recently added element last (except for while steps 7 to 10 of the above algorithm are being executed, of course).*

When the steps below require the UA to **clear the list of active formatting elements up to the last marker**, the UA must perform the following steps:

1. Let *entry* be the last (most recently added) entry in the [list of active formatting elements](#)<sup>p1288</sup>.
2. Remove *entry* from the [list of active formatting elements](#)<sup>p1288</sup>.
3. If *entry* was a [marker](#)<sup>p1288</sup>, then stop the algorithm at this point. The list has been cleared up to the last [marker](#)<sup>p1288</sup>.
4. Go to step 1.

#### 13.2.4.4 The element pointers § p1289

Initially, the **head element pointer** and the **form element pointer** are both null.

Once a [head](#)<sup>p173</sup> element has been parsed (whether implicitly or explicitly) the [head element pointer](#)<sup>p1289</sup> gets set to point to this node.

The [form element pointer](#)<sup>p1289</sup> points to the last [form](#)<sup>p514</sup> element that was opened and whose end tag has not yet been seen. It is used to make form controls associate with forms in the face of dramatically bad markup, for historical reasons. It is ignored inside [template](#)<sup>p671</sup> elements.

#### 13.2.4.5 Other parsing state flags § p1289

The **scripting flag** is set to "enabled" if [scripting was enabled](#)<sup>p1083</sup> for the [Document](#)<sup>p130</sup> with which the parser is associated when the parser was created, and "disabled" otherwise.

## Note

The [scripting flag](#)<sup>p1289</sup> can be enabled even when the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup>, even though [script](#)<sup>p652</sup> elements don't execute in that case.

The **frameset-ok flag** is set to "ok" when the parser is created. It is set to "not ok" after certain tokens are seen.

### 13.2.5 Tokenization <sup>§ p12</sup><sub>90</sub>

Implementations must act as if they used the following state machine to tokenize HTML. The state machine must start in the [data state](#)<sup>p1291</sup>. Most states consume a single character, which may have various side-effects, and either switches the state machine to a new state to [reconsume](#)<sup>p1290</sup> the [current input character](#)<sup>p1285</sup>, or switches it to a new state to consume the [next character](#)<sup>p1285</sup>, or stays in the same state to consume the next character. Some states have more complicated behavior and can consume several characters before switching to another state. In some cases, the tokenizer state is also changed by the tree construction stage.

When a state says to **reconsume** a matched character in a specified state, that means to switch to that state, but when it attempts to consume the [next input character](#)<sup>p1285</sup>, provide it with the [current input character](#)<sup>p1285</sup> instead.

The exact behavior of certain states depends on the [insertion mode](#)<sup>p1285</sup> and the [stack of open elements](#)<sup>p1286</sup>. Certain states also use a **temporary buffer** to track progress, and the [character reference state](#)<sup>p1315</sup> uses a **return state** to return to the state it was invoked from.

The output of the tokenization step is a series of zero or more of the following tokens: DOCTYPE, start tag, end tag, comment, character, end-of-file. DOCTYPE tokens have a name, a public identifier, a system identifier, and a **force-quirks flag**. When a DOCTYPE token is created, its name, public identifier, and system identifier must be marked as missing (which is a distinct state from the empty string), and the [force-quirks flag](#)<sup>p1290</sup> must be set to *off* (its other state is *on*). Start and end tag tokens have a tag name, a **self-closing flag**, and a list of attributes, each of which has a name and a value. When a start or end tag token is created, its [self-closing flag](#)<sup>p1290</sup> must be unset (its other state is that it be set), and its attributes list must be empty. Comment and character tokens have data.

When a token is emitted, it must immediately be handled by the [tree construction](#)<sup>p1318</sup> stage. The tree construction stage can affect the state of the tokenization stage, and can insert additional characters into the stream. (For example, the [script](#)<sup>p652</sup> element can result in scripts executing and using the [dynamic markup insertion](#)<sup>p1150</sup> APIs to insert characters into the stream being tokenized.)

## Note

Creating a token and emitting it are distinct actions. It is possible for a token to be created but implicitly abandoned (never emitted), e.g. if the file ends unexpectedly while processing the characters that are being parsed into a start tag token.

When a start tag token is emitted with its [self-closing flag](#)<sup>p1290</sup> set, if the flag is not **acknowledged** when it is processed by the tree construction stage, that is a [non-void-html-element-start-tag-with-trailing-solidus](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>.

When an end tag token is emitted with attributes, that is an [end-tag-with-attributes](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>.

When an end tag token is emitted with its [self-closing flag](#)<sup>p1290</sup> set, that is an [end-tag-with-trailing-solidus](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>.

An **appropriate end tag token** is an end tag token whose tag name matches the tag name of the last start tag to have been emitted from this tokenizer, if any. If no start tag has been emitted from this tokenizer, then no end tag token is appropriate.

A [character reference](#)<sup>p1269</sup> is said to be **consumed as part of an attribute** if the [return state](#)<sup>p1290</sup> is either [attribute value \(double-quoted\) state](#)<sup>p1302</sup>, [attribute value \(single-quoted\) state](#)<sup>p1303</sup> or [attribute value \(unquoted\) state](#)<sup>p1303</sup>.

When a state says to **flush code points consumed as a character reference**, it means that for each [code point](#) in the [temporary buffer](#)<sup>p1290</sup> (in the order they were added to the buffer) user agent must append the code point from the buffer to the current attribute's value if the character reference was [consumed as part of an attribute](#)<sup>p1290</sup>, or emit the code point as a character token otherwise.

Before each step of the tokenizer, the user agent must first check the [parser pause flag](#)<sup>p1273</sup>. If it is true, then the tokenizer must abort the processing of any nested invocations of the tokenizer, yielding control back to the caller.

The tokenizer state machine consists of the states defined in the following subsections.

#### 13.2.5.1 Data state §<sup>p12</sup><sub>91</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1290</sup>](#) to the [data state<sup>p1291</sup>](#). Switch to the [character reference state<sup>p1315</sup>](#).

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [tag open state<sup>p1292</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

#### 13.2.5.2 RCDATA state §<sup>p12</sup><sub>91</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1290</sup>](#) to the [RCDATA state<sup>p1291</sup>](#). Switch to the [character reference state<sup>p1315</sup>](#).

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [RCDATA less-than sign state<sup>p1293</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

#### 13.2.5.3 RAWTEXT state §<sup>p12</sup><sub>91</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [RAWTEXT less-than sign state<sup>p1294</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

#### 13.2.5.4 Script data state §<sup>p12</sup><sub>91</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data less-than sign state<sup>p1295</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

**13.2.5.5 PLAINTEXT state** §<sup>p12</sup><sub>92</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

**13.2.5.6 Tag open state** §<sup>p12</sup><sub>92</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [markup declaration open state<sup>p1305</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [end tag open state<sup>p1292</sup>](#).

↪ **ASCII alpha**

Create a new start tag token, set its tag name to the empty string. [Reconsume<sup>p1290</sup>](#) in the [tag name state<sup>p1293</sup>](#).

↪ **U+003F QUESTION MARK (?)**

This is an [unexpected-question-mark-instead-of-tag-name<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Create a comment token whose data is the empty string. [Reconsume<sup>p1290</sup>](#) in the [bogus comment state<sup>p1304</sup>](#).

↪ **EOF**

This is an [eof-before-tag-name<sup>p1273</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+003C LESS-THAN SIGN character token and an end-of-file token.

↪ **Anything else**

This is an [invalid-first-character-of-tag-name<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1290</sup>](#) in the [data state<sup>p1291</sup>](#).

**13.2.5.7 End tag open state** §<sup>p12</sup><sub>92</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1290</sup>](#) in the [tag name state<sup>p1293</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-end-tag-name<sup>p1275</sup>](#) [parse error<sup>p1273</sup>](#). Switch to the [data state<sup>p1291</sup>](#).

↪ **EOF**

This is an [eof-before-tag-name<sup>p1273</sup>](#) [parse error<sup>p1273</sup>](#). Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token and an end-of-file token.

↪ **Anything else**

This is an [invalid-first-character-of-tag-name<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Create a comment token whose data is the empty string. [Reconsume<sup>p1290</sup>](#) in the [bogus comment state<sup>p1304</sup>](#).

### 13.2.5.8 Tag name state §<sup>p12</sup> 93

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before attribute name state<sup>p1301</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [self-closing start tag state<sup>p1304</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1291</sup>](#). Emit the current tag token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1285</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current tag token's tag name.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the current tag token's tag name.

### 13.2.5.9 RCDATA less-than sign state §<sup>p12</sup> 93

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Switch to the [RCDATA end tag open state<sup>p1293</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1290</sup>](#) in the [RCDATA state<sup>p1291</sup>](#).

### 13.2.5.10 RCDATA end tag open state §<sup>p12</sup> 93

Consume the [next input character<sup>p1285</sup>](#):

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1290</sup>](#) in the [RCDATA end tag name state<sup>p1294</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume<sup>p1290</sup>](#) in the [RCDATA state<sup>p1291</sup>](#).

### 13.2.5.11 RCDATA end tag name state §<sup>p12</sup><sub>94</sub>

Consume the [next input character<sup>p1285</sup>](#):

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token<sup>p1290</sup>](#), then switch to the [before attribute name state<sup>p1301</sup>](#). Otherwise, treat it as per the "anything else" entry below.

- ↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token<sup>p1290</sup>](#), then switch to the [self-closing start tag state<sup>p1304</sup>](#). Otherwise, treat it as per the "anything else" entry below.

- ↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token<sup>p1290</sup>](#), then switch to the [data state<sup>p1291</sup>](#) and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

- ↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1285</sup>](#) (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character<sup>p1285</sup>](#) to the [temporary buffer<sup>p1290</sup>](#).

- ↪ **ASCII lower alpha**

Append the [current input character<sup>p1285</sup>](#) to the current tag token's tag name. Append the [current input character<sup>p1285</sup>](#) to the [temporary buffer<sup>p1290</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer<sup>p1290</sup>](#) (in the order they were added to the buffer). [Reconsume<sup>p1290</sup>](#) in the [RCDATA state<sup>p1291</sup>](#).

### 13.2.5.12 RAWTEXT less-than sign state §<sup>p12</sup><sub>94</sub>

Consume the [next input character<sup>p1285</sup>](#):

- ↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Switch to the [RAWTEXT end tag open state<sup>p1294</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1290</sup>](#) in the [RAWTEXT state<sup>p1291</sup>](#).

### 13.2.5.13 RAWTEXT end tag open state §<sup>p12</sup><sub>94</sub>

Consume the [next input character<sup>p1285</sup>](#):

- ↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume<sup>p1290</sup>](#) in the [RAWTEXT end tag name state<sup>p1294</sup>](#).

- ↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume<sup>p1290</sup>](#) in the [RAWTEXT state<sup>p1291</sup>](#).

### 13.2.5.14 RAWTEXT end tag name state §<sup>p12</sup><sub>94</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [before attribute name state](#)<sup>p1301</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [self-closing start tag state](#)<sup>p1304</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [data state](#)<sup>p1291</sup> and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1285</sup> to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer](#)<sup>p1290</sup> (in the order they were added to the buffer). [Reconsume](#)<sup>p1290</sup> in the [RAWTEXT state](#)<sup>p1291</sup>.

**13.2.5.15 Script data less-than sign state** §<sup>p12</sup><sub>95</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer](#)<sup>p1290</sup> to the empty string. Switch to the [script data end tag open state](#)<sup>p1295</sup>.

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [script data escape start state](#)<sup>p1296</sup>. Emit a U+003C LESS-THAN SIGN character token and a U+0021 EXCLAMATION MARK character token.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume](#)<sup>p1290</sup> in the [script data state](#)<sup>p1291</sup>.

**13.2.5.16 Script data end tag open state** §<sup>p12</sup><sub>95</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume](#)<sup>p1290</sup> in the [script data end tag name state](#)<sup>p1295</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume](#)<sup>p1290</sup> in the [script data state](#)<sup>p1291</sup>.

**13.2.5.17 Script data end tag name state** §<sup>p12</sup><sub>95</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [before attribute name state](#)<sup>p1301</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [self-closing start tag state](#)<sup>p1304</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [data state](#)<sup>p1291</sup> and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1285</sup> to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer](#)<sup>p1290</sup> (in the order they were added to the buffer). [Reconsume](#)<sup>p1290</sup> in the [script data state](#)<sup>p1291</sup>.

**13.2.5.18 Script data escape start state** §<sup>p12</sup><sub>96</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escape start dash state](#)<sup>p1296</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [script data state](#)<sup>p1291</sup>.

**13.2.5.19 Script data escape start dash state** §<sup>p12</sup><sub>96</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state](#)<sup>p1297</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [script data state](#)<sup>p1291</sup>.

**13.2.5.20 Script data escaped state** §<sup>p12</sup><sub>96</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash state](#)<sup>p1297</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state](#)<sup>p1297</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character<sup>p1285</sup>](#) as a character token.

**13.2.5.21 Script data escaped dash state** § <sup>p12</sup><sub>97</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data escaped dash dash state<sup>p1297</sup>](#). Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p1297</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Switch to the [script data escaped state<sup>p1296</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data escaped state<sup>p1296</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

**13.2.5.22 Script data escaped dash dash state** § <sup>p12</sup><sub>97</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data escaped less-than sign state<sup>p1297</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state<sup>p1291</sup>](#). Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Switch to the [script data escaped state<sup>p1296</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data escaped state<sup>p1296</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

**13.2.5.23 Script data escaped less-than sign state** § <sup>p12</sup><sub>97</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Switch to the [script data escaped end tag open state<sup>p1298</sup>](#).

↪ **ASCII alpha**

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Emit a U+003C LESS-THAN SIGN character token. [Reconsume<sup>p1290</sup>](#) in the [script data double escape start state<sup>p1298</sup>](#).

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token. [Reconsume](#)<sup>p1290</sup> in the [script data escaped state](#)<sup>p1296</sup>.

**13.2.5.24 Script data escaped end tag open state** §<sup>p12</sup><sub>98</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **ASCII alpha**

Create a new end tag token, set its tag name to the empty string. [Reconsume](#)<sup>p1290</sup> in the [script data escaped end tag name state](#)<sup>p1298</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token and a U+002F SOLIDUS character token. [Reconsume](#)<sup>p1290</sup> in the [script data escaped state](#)<sup>p1296</sup>.

**13.2.5.25 Script data escaped end tag name state** §<sup>p12</sup><sub>98</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [before attribute name state](#)<sup>p1301</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+002F SOLIDUS (/)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [self-closing start tag state](#)<sup>p1304</sup>. Otherwise, treat it as per the "anything else" entry below.

↪ **U+003E GREATER-THAN SIGN (>)**

If the current end tag token is an [appropriate end tag token](#)<sup>p1290</sup>, then switch to the [data state](#)<sup>p1291</sup> and emit the current tag token. Otherwise, treat it as per the "anything else" entry below.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1285</sup> to the current tag token's tag name. Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>.

↪ **Anything else**

Emit a U+003C LESS-THAN SIGN character token, a U+002F SOLIDUS character token, and a character token for each of the characters in the [temporary buffer](#)<sup>p1290</sup> (in the order they were added to the buffer). [Reconsume](#)<sup>p1290</sup> in the [script data escaped state](#)<sup>p1296</sup>.

**13.2.5.26 Script data double escape start state** §<sup>p12</sup><sub>98</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer](#)<sup>p1290</sup> is the string "script", then switch to the [script data double escaped state](#)<sup>p1299</sup>. Otherwise, switch to the [script data escaped state](#)<sup>p1296</sup>. Emit the [current input character](#)<sup>p1285</sup> as a character token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the [temporary buffer](#)<sup>p1290</sup>. Emit the [current input character](#)<sup>p1285</sup> as a character token.

↪ **ASCII lower alpha**

Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>. Emit the [current input character](#)<sup>p1285</sup> as a character token.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [script data escaped state](#)<sup>p1296</sup>.

### 13.2.5.27 Script data double escaped state <sup>p12</sup><sub>99</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash state](#)<sup>p1299</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state](#)<sup>p1300</sup>. Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit an end-of-file token.

↪ **Anything else**

Emit the [current input character](#)<sup>p1285</sup> as a character token.

### 13.2.5.28 Script data double escaped dash state <sup>p12</sup><sub>99</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [script data double escaped dash dash state](#)<sup>p1300</sup>. Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state](#)<sup>p1300</sup>. Emit a U+003C LESS-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Switch to the [script data double escaped state](#)<sup>p1299</sup>. Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data double escaped state](#)<sup>p1299</sup>. Emit the [current input character](#)<sup>p1285</sup> as a character token.

### 13.2.5.29 Script data double escaped dash dash state §<sup>p13</sup><sub>00</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002D HYPHEN-MINUS (-)**

Emit a U+002D HYPHEN-MINUS character token.

↪ **U+003C LESS-THAN SIGN (<)**

Switch to the [script data double escaped less-than sign state<sup>p1300</sup>](#). Emit a U+003C LESS-THAN SIGN character token.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [script data state<sup>p1291</sup>](#). Emit a U+003E GREATER-THAN SIGN character token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Switch to the [script data double escaped state<sup>p1299</sup>](#). Emit a U+FFFD REPLACEMENT CHARACTER character token.

↪ **EOF**

This is an [eof-in-script-html-comment-like-text<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Switch to the [script data double escaped state<sup>p1299</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

### 13.2.5.30 Script data double escaped less-than sign state §<sup>p13</sup><sub>00</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+002F SOLIDUS (/)**

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Switch to the [script data double escape end state<sup>p1300</sup>](#). Emit a U+002F SOLIDUS character token.

↪ **Anything else**

[Reconsume<sup>p1290</sup>](#) in the [script data double escaped state<sup>p1299</sup>](#).

### 13.2.5.31 Script data double escape end state §<sup>p13</sup><sub>00</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

↪ **U+002F SOLIDUS (/)**

↪ **U+003E GREATER-THAN SIGN (>)**

If the [temporary buffer<sup>p1290</sup>](#) is the string "script", then switch to the [script data escaped state<sup>p1296</sup>](#). Otherwise, switch to the [script data double escaped state<sup>p1299</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character<sup>p1285</sup>](#) (add 0x0020 to the character's code point) to the [temporary buffer<sup>p1290</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

↪ **ASCII lower alpha**

Append the [current input character<sup>p1285</sup>](#) to the [temporary buffer<sup>p1290</sup>](#). Emit the [current input character<sup>p1285</sup>](#) as a character token.

↪ **Anything else**

[Reconsume<sup>p1290</sup>](#) in the [script data double escaped state<sup>p1299</sup>](#).

### 13.2.5.32 Before attribute name state §<sup>p13</sup><sub>01</sub>

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

Ignore the character.

- ↪ **U+002F SOLIDUS (/)**
- ↪ **U+003E GREATER-THAN SIGN (>)**
- ↪ **EOF**

[Reconsume](#)<sup>p1290</sup> in the [after attribute name state](#)<sup>p1302</sup>.

- ↪ **U+003D EQUALS SIGN (=)**

This is an [unexpected-equals-sign-before-attribute-name](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Start a new attribute in the current tag token. Set that attribute's name to the [current input character](#)<sup>p1285</sup>, and its value to the empty string. Switch to the [attribute name state](#)<sup>p1301</sup>.

- ↪ **Anything else**

Start a new attribute in the current tag token. Set that attribute name and value to the empty string. [Reconsume](#)<sup>p1290</sup> in the [attribute name state](#)<sup>p1301</sup>.

### 13.2.5.33 Attribute name state §<sup>p13</sup><sub>01</sub>

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**
- ↪ **U+002F SOLIDUS (/)**
- ↪ **U+003E GREATER-THAN SIGN (>)**
- ↪ **EOF**

[Reconsume](#)<sup>p1290</sup> in the [after attribute name state](#)<sup>p1302</sup>.

- ↪ **U+003D EQUALS SIGN (=)**

Switch to the [before attribute value state](#)<sup>p1302</sup>.

- ↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the current attribute's name.

- ↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's name.

- ↪ **U+0022 QUOTATION MARK (")**
- ↪ **U+0027 APOSTROPHE (')**
- ↪ **U+003C LESS-THAN SIGN (<)**

This is an [unexpected-character-in-attribute-name](#)<sup>p1276</sup> [parse error](#)<sup>p1273</sup>. Treat it as per the "anything else" entry below.

- ↪ **Anything else**

Append the [current input character](#)<sup>p1285</sup> to the current attribute's name.

When the user agent leaves the attribute name state (and before emitting the tag token, if appropriate), the complete attribute's name must be compared to the other attributes on the same token; if there is already an attribute on the token with the exact same name, then this is a [duplicate-attribute](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup> and the new attribute must be removed from the token.

**Note**

*If an attribute is so removed from a token, it, and the value that gets associated with it, if any, are never subsequently used by the parser, and are therefore effectively discarded. Removing the attribute in this way does not change its status as the "current attribute" for the purposes of the tokenizer, however.*

### 13.2.5.34 After attribute name state § p13 02

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**  
Ignore the character.
- ↪ **U+002F SOLIDUS (/)**  
Switch to the [self-closing start tag state](#)<sup>p1304</sup>.
- ↪ **U+003D EQUALS SIGN (=)**  
Switch to the [before attribute value state](#)<sup>p1302</sup>.
- ↪ **U+003E GREATER-THAN SIGN (>)**  
Switch to the [data state](#)<sup>p1291</sup>. Emit the current tag token.
- ↪ **EOF**  
This is an [eof-in-tag](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit an end-of-file token.
- ↪ **Anything else**  
Start a new attribute in the current tag token. Set that attribute name and value to the empty string. [Reconsume](#)<sup>p1290</sup> in the [attribute name state](#)<sup>p1301</sup>.

### 13.2.5.35 Before attribute value state § p13 02

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**  
Ignore the character.
- ↪ **U+0022 QUOTATION MARK (")**  
Switch to the [attribute value \(double-quoted\) state](#)<sup>p1302</sup>.
- ↪ **U+0027 APOSTROPHE (')**  
Switch to the [attribute value \(single-quoted\) state](#)<sup>p1303</sup>.
- ↪ **U+003E GREATER-THAN SIGN (>)**  
This is a [missing-attribute-value](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Switch to the [data state](#)<sup>p1291</sup>. Emit the current tag token.
- ↪ **Anything else**  
[Reconsume](#)<sup>p1290</sup> in the [attribute value \(unquoted\) state](#)<sup>p1303</sup>.

### 13.2.5.36 Attribute value (double-quoted) state § p13 02

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0022 QUOTATION MARK (")**  
Switch to the [after attribute value \(quoted\) state](#)<sup>p1304</sup>.

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1290</sup>](#) to the [attribute value \(double-quoted\) state<sup>p1302</sup>](#). Switch to the [character reference state<sup>p1315</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the current attribute's value.

**13.2.5.37 Attribute value (single-quoted) state** §<sup>p13</sup><sub>03</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0027 APOSTROPHE (')**

Switch to the [after attribute value \(quoted\) state<sup>p1304</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1290</sup>](#) to the [attribute value \(single-quoted\) state<sup>p1303</sup>](#). Switch to the [character reference state<sup>p1315</sup>](#).

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the current attribute's value.

**13.2.5.38 Attribute value (unquoted) state** §<sup>p13</sup><sub>03</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before attribute name state<sup>p1301</sup>](#).

↪ **U+0026 AMPERSAND (&)**

Set the [return state<sup>p1290</sup>](#) to the [attribute value \(unquoted\) state<sup>p1303</sup>](#). Switch to the [character reference state<sup>p1315</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1291</sup>](#). Emit the current tag token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the current attribute's value.

↪ **U+0022 QUOTATION MARK (")**

↪ **U+0027 APOSTROPHE (')**

↪ **U+003C LESS-THAN SIGN (<)**

↪ **U+003D EQUALS SIGN (=)**

↪ **U+0060 GRAVE ACCENT (`)**

This is an [unexpected-character-in-unquoted-attribute-value<sup>p1276</sup>](#) [parse error<sup>p1273</sup>](#). Treat it as per the "anything else" entry below.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the current attribute's value.

**13.2.5.39 After attribute value (quoted) state** §<sup>p13</sup><sub>04</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before attribute name state<sup>p1301</sup>](#).

↪ **U+002F SOLIDUS (/)**

Switch to the [self-closing start tag state<sup>p1304</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1291</sup>](#). Emit the current tag token.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

This is a [missing-whitespace-between-attributes<sup>p1275</sup>](#) [parse error<sup>p1273</sup>](#). [Reconsume<sup>p1290</sup>](#) in the [before attribute name state<sup>p1301</sup>](#).

**13.2.5.40 Self-closing start tag state** §<sup>p13</sup><sub>04</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+003E GREATER-THAN SIGN (>)**

Set the [self-closing flag<sup>p1290</sup>](#) of the current tag token. Switch to the [data state<sup>p1291</sup>](#). Emit the current tag token.

↪ **EOF**

This is an [eof-in-tag<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Emit an end-of-file token.

↪ **Anything else**

This is an [unexpected-solidus-in-tag<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). [Reconsume<sup>p1290</sup>](#) in the [before attribute name state<sup>p1301</sup>](#).

**13.2.5.41 Bogus comment state** §<sup>p13</sup><sub>04</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1291</sup>](#). Emit the current comment token.

↪ **EOF**

Emit the comment. Emit an end-of-file token.

↪ **U+0000 NULL**

This is an [unexpected-null-character<sup>p1277</sup>](#) [parse error<sup>p1273</sup>](#). Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the comment token's data.

#### 13.2.5.42 Markup declaration open state § p1305

If the next few characters are:

↪ **Two U+002D HYPHEN-MINUS characters (-)**

Consume those two characters, create a comment token whose data is the empty string, and switch to the [comment\\_start state](#)<sup>p1305</sup>.

↪ **ASCII case-insensitive match for the word "DOCTYPE"**

Consume those characters and switch to the [DOCTYPE state](#)<sup>p1307</sup>.

↪ **The string "[CDATA[" (the five uppercase letters "CDATA" with a U+005B LEFT SQUARE BRACKET character before and after)**

Consume those characters. If there is an [adjusted\\_current\\_node](#)<sup>p1287</sup> and it is not an element in the [HTML namespace](#), then switch to the [CDATA section state](#)<sup>p1314</sup>. Otherwise, this is a [cdata-in-html-content](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Create a comment token whose data is the "[CDATA[" string. Switch to the [bogus comment state](#)<sup>p1304</sup>.

↪ **Anything else**

This is an [incorrectly-opened-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Create a comment token whose data is the empty string. Switch to the [bogus comment state](#)<sup>p1304</sup> (don't consume anything in the current state).

#### 13.2.5.43 Comment start state § p1305

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment\\_start\\_dash state](#)<sup>p1305</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-closing-of-empty-comment](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Switch to the [data state](#)<sup>p1291</sup>. Emit the current comment token.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

#### 13.2.5.44 Comment start dash state § p1305

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment\\_end state](#)<sup>p1307</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-closing-of-empty-comment](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Switch to the [data state](#)<sup>p1291</sup>. Emit the current comment token.

↪ **EOF**

This is an [eof-in-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit the current comment token. Emit an end-of-file token.

↪ **Anything else**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data. [Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

#### 13.2.5.45 Comment state § p1305

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+003C LESS-THAN SIGN (<)**

Append the [current input character](#)<sup>p1285</sup> to the comment token's data. Switch to the [comment\\_less-than sign state](#)<sup>p1306</sup>.

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment\\_end dash state](#)<sup>p1307</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the comment token's data.

↪ **EOF**

This is an [eof-in-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit the current comment token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character](#)<sup>p1285</sup> to the comment token's data.

**13.2.5.46 Comment less-than sign state** §<sup>p13</sup><sub>06</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0021 EXCLAMATION MARK (!)**

Append the [current input character](#)<sup>p1285</sup> to the comment token's data. Switch to the [comment less-than sign bang state](#)<sup>p1306</sup>.

↪ **U+003C LESS-THAN SIGN (<)**

Append the [current input character](#)<sup>p1285</sup> to the comment token's data.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

**13.2.5.47 Comment less-than sign bang state** §<sup>p13</sup><sub>06</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment less-than sign bang dash state](#)<sup>p1306</sup>.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

**13.2.5.48 Comment less-than sign bang dash state** §<sup>p13</sup><sub>06</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment less-than sign bang dash dash state](#)<sup>p1306</sup>.

↪ **Anything else**

[Reconsume](#)<sup>p1290</sup> in the [comment end dash state](#)<sup>p1307</sup>.

**13.2.5.49 Comment less-than sign bang dash dash state** §<sup>p13</sup><sub>06</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+003E GREATER-THAN SIGN (>)**

↪ **EOF**

[Reconsume](#)<sup>p1290</sup> in the [comment end state](#)<sup>p1307</sup>.

↪ **Anything else**

This is a [nested-comment](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [comment end state](#)<sup>p1307</sup>.

#### 13.2.5.50 Comment end dash state § p13 07

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Switch to the [comment end state](#)<sup>p1307</sup>.

↪ **EOF**

This is an [eof-in-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit the current comment token. Emit an end-of-file token.

↪ **Anything else**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data. [Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

#### 13.2.5.51 Comment end state § p13 07

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p1291</sup>. Emit the current comment token.

↪ **U+0021 EXCLAMATION MARK (!)**

Switch to the [comment end bang state](#)<sup>p1307</sup>.

↪ **U+002D HYPHEN-MINUS (-)**

Append a U+002D HYPHEN-MINUS character (-) to the comment token's data.

↪ **EOF**

This is an [eof-in-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit the current comment token. Emit an end-of-file token.

↪ **Anything else**

Append two U+002D HYPHEN-MINUS characters (-) to the comment token's data. [Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

#### 13.2.5.52 Comment end bang state § p13 07

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+002D HYPHEN-MINUS (-)**

Append two U+002D HYPHEN-MINUS characters (-) and a U+0021 EXCLAMATION MARK character (!) to the comment token's data. Switch to the [comment end dash state](#)<sup>p1307</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [incorrectly-closed-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Switch to the [data state](#)<sup>p1291</sup>. Emit the current comment token.

↪ **EOF**

This is an [eof-in-comment](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit the current comment token. Emit an end-of-file token.

↪ **Anything else**

Append two U+002D HYPHEN-MINUS characters (-) and a U+0021 EXCLAMATION MARK character (!) to the comment token's data. [Reconsume](#)<sup>p1290</sup> in the [comment state](#)<sup>p1305</sup>.

#### 13.2.5.53 DOCTYPE state § p13 07

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE name state](#)<sup>p1308</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

Reconsume<sup>p1290</sup> in the [before DOCTYPE name state](#)<sup>p1308</sup>.

↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Create a new DOCTYPE token. Set its [force-quirks flag](#)<sup>p1290</sup> to *on*. Emit the current token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-whitespace-before-doctype-name](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [before DOCTYPE name state](#)<sup>p1308</sup>.

**13.2.5.54 Before DOCTYPE name state** §<sup>p13</sup><sub>08</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **ASCII upper alpha**

Create a new DOCTYPE token. Set the token's name to the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point). Switch to the [DOCTYPE name state](#)<sup>p1308</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Create a new DOCTYPE token. Set the token's name to a U+FFFD REPLACEMENT CHARACTER character. Switch to the [DOCTYPE name state](#)<sup>p1308</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-name](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Create a new DOCTYPE token. Set its [force-quirks flag](#)<sup>p1290</sup> to *on*. Switch to the [data state](#)<sup>p1291</sup>. Emit the current token.

↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Create a new DOCTYPE token. Set its [force-quirks flag](#)<sup>p1290</sup> to *on*. Emit the current token. Emit an end-of-file token.

↪ **Anything else**

Create a new DOCTYPE token. Set the token's name to the [current input character](#)<sup>p1285</sup>. Switch to the [DOCTYPE name state](#)<sup>p1308</sup>.

**13.2.5.55 DOCTYPE name state** §<sup>p13</sup><sub>08</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [after DOCTYPE name state](#)<sup>p1309</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p1291</sup>. Emit the current DOCTYPE token.

↪ **ASCII upper alpha**

Append the lowercase version of the [current input character](#)<sup>p1285</sup> (add 0x0020 to the character's code point) to the current DOCTYPE token's name.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's name.

↪ **EOF**

This is an [eof-in-doctype<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to *on*. Emit the current DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character<sup>p1285</sup>](#) to the current DOCTYPE token's name.

**13.2.5.56 After DOCTYPE name state** §<sup>p13</sup><sub>09</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Ignore the character.

↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state<sup>p1291</sup>](#). Emit the current DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to *on*. Emit the current DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

If the six characters starting from the [current input character<sup>p1285</sup>](#) are an [ASCII case-insensitive](#) match for the word "PUBLIC", then consume those characters and switch to the [after DOCTYPE public keyword state<sup>p1309</sup>](#).

Otherwise, if the six characters starting from the [current input character<sup>p1285</sup>](#) are an [ASCII case-insensitive](#) match for the word "SYSTEM", then consume those characters and switch to the [after DOCTYPE system keyword state<sup>p1312</sup>](#).

Otherwise, this is an [invalid-character-sequence-after-doctype-name<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to *on*. [Reconsume<sup>p1290</sup>](#) in the [bogus DOCTYPE state<sup>p1314</sup>](#).

**13.2.5.57 After DOCTYPE public keyword state** §<sup>p13</sup><sub>09</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+0009 CHARACTER TABULATION (tab)**

↪ **U+000A LINE FEED (LF)**

↪ **U+000C FORM FEED (FF)**

↪ **U+0020 SPACE**

Switch to the [before DOCTYPE public identifier state<sup>p1310</sup>](#).

↪ **U+0022 QUOTATION MARK (")**

This is a [missing-whitespace-after-doctype-public-keyword<sup>p1275</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(double-quoted\) state<sup>p1310</sup>](#).

↪ **U+0027 APOSTROPHE (')**

This is a [missing-whitespace-after-doctype-public-keyword<sup>p1275</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's public identifier to the empty string (not missing), then switch to the [DOCTYPE public identifier \(single-quoted\) state<sup>p1310</sup>](#).

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-public-identifier<sup>p1274</sup>](#) [parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to *on*. Switch to the [data state<sup>p1291</sup>](#). Emit the current DOCTYPE token.

#### ↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1275</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to on. [Reconsume<sup>p1290</sup>](#) in the [bogus DOCTYPE state<sup>p1314</sup>](#).

### 13.2.5.63 After DOCTYPE system keyword state §<sup>p13</sup> 12

Consume the [next input character<sup>p1285</sup>](#):

#### ↪ **U+0009 CHARACTER TABULATION (tab)**

#### ↪ **U+000A LINE FEED (LF)**

#### ↪ **U+000C FORM FEED (FF)**

#### ↪ **U+0020 SPACE**

Switch to the [before DOCTYPE system identifier state<sup>p1312</sup>](#).

#### ↪ **U+0022 QUOTATION MARK (")**

This is a [missing-whitespace-after-doctype-system-keyword<sup>p1275</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1313</sup>](#).

#### ↪ **U+0027 APOSTROPHE (')**

This is a [missing-whitespace-after-doctype-system-keyword<sup>p1275</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state<sup>p1313</sup>](#).

#### ↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-system-identifier<sup>p1275</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to on. Switch to the [data state<sup>p1291</sup>](#). Emit the current DOCTYPE token.

#### ↪ **EOF**

This is an [eof-in-doctype<sup>p1274</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to on. Emit the current DOCTYPE token. Emit an end-of-file token.

#### ↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier<sup>p1275</sup> parse error<sup>p1273</sup>](#). Set the current DOCTYPE token's [force-quirks flag<sup>p1290</sup>](#) to on. [Reconsume<sup>p1290</sup>](#) in the [bogus DOCTYPE state<sup>p1314</sup>](#).

### 13.2.5.64 Before DOCTYPE system identifier state §<sup>p13</sup> 12

Consume the [next input character<sup>p1285</sup>](#):

#### ↪ **U+0009 CHARACTER TABULATION (tab)**

#### ↪ **U+000A LINE FEED (LF)**

#### ↪ **U+000C FORM FEED (FF)**

#### ↪ **U+0020 SPACE**

Ignore the character.

#### ↪ **U+0022 QUOTATION MARK (")**

Set the current DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(double-quoted\) state<sup>p1313</sup>](#).

↪ **U+0027 APOSTROPHE (')**

Set the current DOCTYPE token's system identifier to the empty string (not missing), then switch to the [DOCTYPE system identifier \(single-quoted\) state](#)<sup>p1313</sup>.

↪ **U+003E GREATER-THAN SIGN (>)**

This is a [missing-doctype-system-identifier](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Switch to the [data state](#)<sup>p1291</sup>. Emit the current DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Emit the current DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

This is a [missing-quote-before-doctype-system-identifier](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. [Reconsume](#)<sup>p1290</sup> in the [bogus DOCTYPE state](#)<sup>p1314</sup>.

**13.2.5.65 DOCTYPE system identifier (double-quoted) state** §<sup>p13</sup><sub>13</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0022 QUOTATION MARK (")**

Switch to the [after DOCTYPE system identifier state](#)<sup>p1314</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-system-identifier](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Switch to the [data state](#)<sup>p1291</sup>. Emit the current DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Emit the current DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character](#)<sup>p1285</sup> to the current DOCTYPE token's system identifier.

**13.2.5.66 DOCTYPE system identifier (single-quoted) state** §<sup>p13</sup><sub>13</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+0027 APOSTROPHE (')**

Switch to the [after DOCTYPE system identifier state](#)<sup>p1314</sup>.

↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Append a U+FFFD REPLACEMENT CHARACTER character to the current DOCTYPE token's system identifier.

↪ **U+003E GREATER-THAN SIGN (>)**

This is an [abrupt-doctype-system-identifier](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Switch to the [data state](#)<sup>p1291</sup>. Emit the current DOCTYPE token.

↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to on. Emit the current DOCTYPE token. Emit an end-of-file token.

↪ **Anything else**

Append the [current input character](#)<sup>p1285</sup> to the current DOCTYPE token's system identifier.

### 13.2.5.67 After DOCTYPE system identifier state §<sup>p13</sup><sub>14</sub>

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+0009 CHARACTER TABULATION (tab)**
- ↪ **U+000A LINE FEED (LF)**
- ↪ **U+000C FORM FEED (FF)**
- ↪ **U+0020 SPACE**

Ignore the character.

- ↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p1291</sup>. Emit the current DOCTYPE token.

- ↪ **EOF**

This is an [eof-in-doctype](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to *on*. Emit the current DOCTYPE token. Emit an end-of-file token.

- ↪ **Anything else**

This is an [unexpected-character-after-doctype-system-identifier](#)<sup>p1276</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [bogus DOCTYPE state](#)<sup>p1314</sup>. (This does *not* set the current DOCTYPE token's [force-quirks flag](#)<sup>p1290</sup> to *on*.)

### 13.2.5.68 Bogus DOCTYPE state §<sup>p13</sup><sub>14</sub>

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+003E GREATER-THAN SIGN (>)**

Switch to the [data state](#)<sup>p1291</sup>. Emit the DOCTYPE token.

- ↪ **U+0000 NULL**

This is an [unexpected-null-character](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. Ignore the character.

- ↪ **EOF**

Emit the DOCTYPE token. Emit an end-of-file token.

- ↪ **Anything else**

Ignore the character.

### 13.2.5.69 CDATA section state §<sup>p13</sup><sub>14</sub>

Consume the [next input character](#)<sup>p1285</sup>:

- ↪ **U+005D RIGHT SQUARE BRACKET (])**

Switch to the [CDATA section bracket state](#)<sup>p1314</sup>.

- ↪ **EOF**

This is an [eof-in-cdata](#)<sup>p1274</sup> [parse error](#)<sup>p1273</sup>. Emit an end-of-file token.

- ↪ **Anything else**

Emit the [current input character](#)<sup>p1285</sup> as a character token.

#### Note

*U+0000 NULL characters are handled in the tree construction stage, as part of the [in foreign content](#)<sup>p1356</sup> insertion mode, which is the only place where CDATA sections can appear.*

### 13.2.5.70 CDATA section bracket state §<sup>p13</sup><sub>14</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ **U+005D RIGHT SQUARE BRACKET (])**

Switch to the [CDATA section end state<sup>p1315</sup>](#).

↪ **Anything else**

Emit a U+005D RIGHT SQUARE BRACKET character token. [Reconsume<sup>p1290</sup>](#) in the [CDATA section state<sup>p1314</sup>](#).

**13.2.5.71 CDATA section end state** §<sup>p13</sup><sub>15</sub>

Consume the [next input character<sup>p1285</sup>](#):

↪ **U+005D RIGHT SQUARE BRACKET (])**

Emit a U+005D RIGHT SQUARE BRACKET character token.

↪ **U+003E GREATER-THAN SIGN character**

Switch to the [data state<sup>p1291</sup>](#).

↪ **Anything else**

Emit two U+005D RIGHT SQUARE BRACKET character tokens. [Reconsume<sup>p1290</sup>](#) in the [CDATA section state<sup>p1314</sup>](#).

**13.2.5.72 Character reference state** §<sup>p13</sup><sub>15</sub>

Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Append a U+0026 AMPERSAND (&) character to the [temporary buffer<sup>p1290</sup>](#). Consume the [next input character<sup>p1285</sup>](#):

↪ **ASCII alphanumeric**

[Reconsume<sup>p1290</sup>](#) in the [named character reference state<sup>p1315</sup>](#).

↪ **U+0023 NUMBER SIGN (#)**

Append the [current input character<sup>p1285</sup>](#) to the [temporary buffer<sup>p1290</sup>](#). Switch to the [numeric character reference state<sup>p1316</sup>](#).

↪ **Anything else**

[Flush code points consumed as a character reference<sup>p1290</sup>](#). [Reconsume<sup>p1290</sup>](#) in the [return state<sup>p1290</sup>](#).

**13.2.5.73 Named character reference state** §<sup>p13</sup><sub>15</sub>

Consume the maximum number of characters possible, where the consumed characters are one of the identifiers in the first column of the [named character references<sup>p1374</sup>](#) table. Append each character to the [temporary buffer<sup>p1290</sup>](#) when it's consumed.

↪ **If there is a match**

If the character reference was [consumed as part of an attribute<sup>p1290</sup>](#), and the last character matched is not a U+003B SEMICOLON character (;), and the [next input character<sup>p1285</sup>](#) is either a U+003D EQUALS SIGN character (=) or an [ASCII alphanumeric](#), then, for historical reasons, [flush code points consumed as a character reference<sup>p1290</sup>](#) and switch to the [return state<sup>p1290</sup>](#).

Otherwise:

1. If the last character matched is not a U+003B SEMICOLON character (;), then this is a [missing-semicolon-after-character-reference<sup>p1275</sup>](#) [parse error<sup>p1273</sup>](#).
2. Set the [temporary buffer<sup>p1290</sup>](#) to the empty string. Append one or two characters corresponding to the character reference name (as given by the second column of the [named character references<sup>p1374</sup>](#) table) to the [temporary buffer<sup>p1290</sup>](#).
3. [Flush code points consumed as a character reference<sup>p1290</sup>](#). Switch to the [return state<sup>p1290</sup>](#).

↪ **Otherwise**

[Flush code points consumed as a character reference<sup>p1290</sup>](#). Switch to the [ambiguous ampersand state<sup>p1316</sup>](#).

If the markup contains (not in an attribute) the string I'm &notit; I tell you, the character reference is parsed as "not", as in, I'm ¬it; I tell you (and this is a parse error). But if the markup was I'm &notin; I tell you, the character reference would be parsed as "notin;", resulting in I'm ∉ I tell you (and no parse error).

However, if the markup contains the string I'm &notit; I tell you in an attribute, no character reference is parsed and string remains intact (and there is no parse error).

#### 13.2.5.74 Ambiguous ampersand state §<sup>p13</sup><sub>16</sub>

Consume the [next input character](#)<sup>p1285</sup>:

##### ↪ ASCII alphanumeric

If the character reference was [consumed as part of an attribute](#)<sup>p1290</sup>, then append the [current input character](#)<sup>p1285</sup> to the current attribute's value. Otherwise, emit the [current input character](#)<sup>p1285</sup> as a character token.

##### ↪ U+003B SEMICOLON (;)

This is an [unknown-named-character-reference](#)<sup>p1277</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [return state](#)<sup>p1290</sup>.

##### ↪ Anything else

[Reconsume](#)<sup>p1290</sup> in the [return state](#)<sup>p1290</sup>.

#### 13.2.5.75 Numeric character reference state §<sup>p13</sup><sub>16</sub>

Set the **character reference code** to zero (0).

Consume the [next input character](#)<sup>p1285</sup>:

##### ↪ U+0078 LATIN SMALL LETTER X

##### ↪ U+0058 LATIN CAPITAL LETTER X

Append the [current input character](#)<sup>p1285</sup> to the [temporary buffer](#)<sup>p1290</sup>. Switch to the [hexadecimal character reference start state](#)<sup>p1316</sup>.

##### ↪ Anything else

[Reconsume](#)<sup>p1290</sup> in the [decimal character reference start state](#)<sup>p1316</sup>.

#### 13.2.5.76 Hexadecimal character reference start state §<sup>p13</sup><sub>16</sub>

Consume the [next input character](#)<sup>p1285</sup>:

##### ↪ ASCII hex digit

[Reconsume](#)<sup>p1290</sup> in the [hexadecimal character reference state](#)<sup>p1317</sup>.

##### ↪ Anything else

This is an [absence-of-digits-in-numeric-character-reference](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. [Flush code points consumed as a character reference](#)<sup>p1290</sup>. [Reconsume](#)<sup>p1290</sup> in the [return state](#)<sup>p1290</sup>.

#### 13.2.5.77 Decimal character reference start state §<sup>p13</sup><sub>16</sub>

Consume the [next input character](#)<sup>p1285</sup>:

##### ↪ ASCII digit

[Reconsume](#)<sup>p1290</sup> in the [decimal character reference state](#)<sup>p1317</sup>.

##### ↪ Anything else

This is an [absence-of-digits-in-numeric-character-reference](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. [Flush code points consumed as a character reference](#)<sup>p1290</sup>. [Reconsume](#)<sup>p1290</sup> in the [return state](#)<sup>p1290</sup>.

13.2.5.78 Hexadecimal character reference state §<sup>p13</sup><sub>17</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ ASCII digit

Multiply the [character reference code](#)<sup>p1316</sup> by 16. Add a numeric version of the [current input character](#)<sup>p1285</sup> (subtract 0x0030 from the character's code point) to the [character reference code](#)<sup>p1316</sup>.

↪ ASCII upper hex digit

Multiply the [character reference code](#)<sup>p1316</sup> by 16. Add a numeric version of the [current input character](#)<sup>p1285</sup> as a hexadecimal digit (subtract 0x0037 from the character's code point) to the [character reference code](#)<sup>p1316</sup>.

↪ ASCII lower hex digit

Multiply the [character reference code](#)<sup>p1316</sup> by 16. Add a numeric version of the [current input character](#)<sup>p1285</sup> as a hexadecimal digit (subtract 0x0057 from the character's code point) to the [character reference code](#)<sup>p1316</sup>.

↪ U+003B SEMICOLON

Switch to the [numeric character reference end state](#)<sup>p1317</sup>.

↪ Anything else

This is a [missing-semicolon-after-character-reference](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [numeric character reference end state](#)<sup>p1317</sup>.

13.2.5.79 Decimal character reference state §<sup>p13</sup><sub>17</sub>

Consume the [next input character](#)<sup>p1285</sup>:

↪ ASCII digit

Multiply the [character reference code](#)<sup>p1316</sup> by 10. Add a numeric version of the [current input character](#)<sup>p1285</sup> (subtract 0x0030 from the character's code point) to the [character reference code](#)<sup>p1316</sup>.

↪ U+003B SEMICOLON

Switch to the [numeric character reference end state](#)<sup>p1317</sup>.

↪ Anything else

This is a [missing-semicolon-after-character-reference](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>. [Reconsume](#)<sup>p1290</sup> in the [numeric character reference end state](#)<sup>p1317</sup>.

13.2.5.80 Numeric character reference end state §<sup>p13</sup><sub>17</sub>

Check the [character reference code](#)<sup>p1316</sup>:

- If the number is 0x00, then this is a [null-character-reference](#)<sup>p1276</sup> [parse error](#)<sup>p1273</sup>. Set the [character reference code](#)<sup>p1316</sup> to 0xFFFFD.
- If the number is greater than 0x10FFFF, then this is a [character-reference-outside-unicode-range](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. Set the [character reference code](#)<sup>p1316</sup> to 0xFFFFD.
- If the number is a [surrogate](#), then this is a [surrogate-character-reference](#)<sup>p1276</sup> [parse error](#)<sup>p1273</sup>. Set the [character reference code](#)<sup>p1316</sup> to 0xFFFFD.
- If the number is a [noncharacter](#), then this is a [noncharacter-character-reference](#)<sup>p1275</sup> [parse error](#)<sup>p1273</sup>.
- If the number is 0x0D, or a [control](#) that's not [ASCII whitespace](#), then this is a [control-character-reference](#)<sup>p1273</sup> [parse error](#)<sup>p1273</sup>. If the number is one of the numbers in the first column of the following table, then find the row with that number in the first column, and set the [character reference code](#)<sup>p1316</sup> to the number in the second column of that row.

Number	Code point	
0x80	0x20AC	EURO SIGN (€)
0x82	0x201A	SINGLE LOW-9 QUOTATION MARK (,)
0x83	0x0192	LATIN SMALL LETTER F WITH HOOK (f)
0x84	0x201E	DOUBLE LOW-9 QUOTATION MARK („)

Set the [temporary buffer](#)<sup>p1290</sup> to the empty string. Append a code point equal to the [character reference code](#)<sup>p1316</sup> to the [temporary buffer](#)<sup>p1290</sup>. [Flush code points consumed as a character reference](#)<sup>p1290</sup>. Switch to the [return state](#)<sup>p1290</sup>.

### 13.2.6 Tree construction <sup>p13</sup><sub>18</sub>

The input to the tree construction stage is a sequence of tokens from the [tokenization](#)<sup>p1290</sup> stage. The tree construction stage is associated with a DOM [Document](#)<sup>p130</sup> object when a parser is created. The "output" of this stage consists of dynamically modifying or extending that document's DOM tree.

This specification does not define when an interactive user agent has to render the [Document](#)<sup>p130</sup> so that it is available to the user, or when it has to begin accepting user input.

As each token is emitted from the tokenizer, the user agent must follow the appropriate steps from the following list, known as the **tree construction dispatcher**:

- ↪ If the [stack of open elements](#)<sup>p1286</sup> is empty
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is an element in the [HTML namespace](#)
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is a [MathML text integration point](#)<sup>p1319</sup> and the token is a start tag whose tag name is neither "mglyph" nor "malignmark"
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is a [MathML text integration point](#)<sup>p1319</sup> and the token is a character token
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is a [MathML annotation-xml](#) element and the token is a start tag whose tag name is "svg"
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is an [HTML integration point](#)<sup>p1319</sup> and the token is a start tag
- ↪ If the [adjusted current node](#)<sup>p1287</sup> is an [HTML integration point](#)<sup>p1319</sup> and the token is a character token
- ↪ If the token is an end-of-file token

Process the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>p1285</sup> in HTML content.

- ↪ **Otherwise**

Process the token according to the rules given in the section for parsing tokens [in foreign content](#)<sup>p1356</sup>.

The **next token** is the token that is about to be processed by the [tree construction dispatcher](#)<sup>p1318</sup> (even if the token is subsequently

just ignored).

A node is a **MathML text integration point** if it is one of the following elements:

- A [MathML \*mi\*](#) element
- A [MathML \*mo\*](#) element
- A [MathML \*mn\*](#) element
- A [MathML \*ms\*](#) element
- A [MathML \*mtext\*](#) element

A node is an **HTML integration point** if it is one of the following elements:

- A [MathML \*annotation-xml\*](#) element whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#) match for the string "text/html"
- A [MathML \*annotation-xml\*](#) element whose start tag token had an attribute with the name "encoding" whose value was an [ASCII case-insensitive](#) match for the string "application/xhtml+xml"
- An [SVG \*foreignObject\*](#) element
- An [SVG \*desc\*](#) element
- An [SVG \*title\*](#) element

#### Note

If the node in question is the [context<sup>p1373</sup>](#) element passed to the [HTML fragment parsing algorithm<sup>p1373</sup>](#), then the start tag token for that element is the "fake" token created during by that [HTML fragment parsing algorithm<sup>p1373</sup>](#).

#### Note

Not all of the tag names mentioned below are conformant tag names in this specification; many are included to handle legacy content. They still form part of the algorithm that implementations are required to implement to claim conformance.

#### Note

The algorithm described below places no limit on the depth of the DOM tree generated, or on the length of tag names, attribute names, attribute values, [Text](#) nodes, etc. While implementers are encouraged to [avoid arbitrary limits](#), it is recognized that practical concerns will likely force user agents to impose nesting depth constraints.

### 13.2.6.1 Creating and inserting nodes <sup>p13</sup><sub>19</sub>

While the parser is processing a token, it can enable or disable **foster parenting**. This affects the following algorithm.

The **appropriate place for inserting a node**, optionally using a particular *override target*, is the position in an element returned by running the following steps:

1. If there was an *override target* specified, then let *target* be the *override target*.

Otherwise, let *target* be the [current node<sup>p1286</sup>](#).

2. Determine the *adjusted insertion location* using the first matching steps from the following list:

↪ If [foster parenting<sup>p1319</sup>](#) is enabled and *target* is a [table<sup>p478</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [thead<sup>p490</sup>](#), or [tr<sup>p492</sup>](#) element

#### Note

Foster parenting happens when content is misnested in tables.

Run these substeps:

1. Let *last template* be the last [template<sup>p671</sup>](#) element in the [stack of open elements<sup>p1286</sup>](#), if any.
2. Let *last table* be the last [table<sup>p478</sup>](#) element in the [stack of open elements<sup>p1286</sup>](#), if any.
3. If there is a *last template* and either there is no *last table*, or there is one, but *last template* is lower (more recently added) than *last table* in the [stack of open elements<sup>p1286</sup>](#), then: let *adjusted insertion location* be inside *last template*'s [template contents<sup>p673</sup>](#), after its last child (if any), and abort these steps.
4. If there is no *last table*, then let *adjusted insertion location* be inside the first element in the [stack of open elements<sup>p1286</sup>](#) (the [html<sup>p172</sup>](#) element), after its last child (if any), and abort these steps. ([fragment case<sup>p1373</sup>](#))

5. If *last table* has a parent node, then let *adjusted insertion location* be inside *last table*'s parent node, immediately before *last table*, and abort these steps.
6. Let *previous element* be the element immediately above *last table* in the [stack of open elements](#)<sup>p1286</sup>.
7. Let *adjusted insertion location* be inside *previous element*, after its last child (if any).

#### Note

*These steps are involved in part because it's possible for elements, the [table](#)<sup>p478</sup> element in this case in particular, to have been moved by a script around in the DOM, or indeed removed from the DOM entirely, after the element was inserted by the parser.*

#### ↪ Otherwise

Let *adjusted insertion location* be inside *target*, after its last child (if any).

3. If the *adjusted insertion location* is inside a [template](#)<sup>p671</sup> element, let it instead be inside the [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup>, after its last child (if any).
4. Return the *adjusted insertion location*.

When the steps below require the UA to **create an element for a token** in a particular *given namespace* and with a particular *intended parent*, the UA must run the following steps:

1. If the [active speculative HTML parser](#)<sup>p1360</sup> is not null, then return the result of [creating a speculative mock element](#)<sup>p1361</sup> given *given namespace*, the tag name of the given token, and the attributes of the given token.
2. Otherwise, optionally [create a speculative mock element](#)<sup>p1361</sup> given *given namespace*, the tag name of the given token, and the attributes of the given token.

#### Note

*The result is not used. This step allows for a [speculative fetch](#)<sup>p1360</sup> to be initiated from non-speculative parsing. The fetch is still speculative at this point, because, for example, by the time the element is inserted, intended parent might have been removed from the document.*

3. Let *document* be *intended parent*'s [node document](#).
4. Let *local name* be the tag name of the token.
5. Let *is* be the value of the "[is](#)<sup>p759</sup>" attribute in the given token, if such an attribute exists, or null otherwise.
6. Let *definition* be the result of [looking up a custom element definition](#)<sup>p761</sup> given *document*, *given namespace*, *local name*, and *is*.
7. If *definition* is non-null and the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup>, then let *will execute script* be true. Otherwise, let it be false.
8. If *will execute script* is true, then:
  1. Increment *document*'s [throw-on-dynamic-markup-insertion counter](#)<sup>p1150</sup>.
  2. If the [JavaScript execution context stack](#) is empty, then [perform a microtask checkpoint](#)<sup>p1131</sup>.
  3. Push a new [element queue](#)<sup>p768</sup> onto *document*'s [relevant agent](#)<sup>p1073</sup>'s [custom element reactions stack](#)<sup>p768</sup>.
9. Let *element* be the result of [creating an element](#) given *document*, *localName*, *given namespace*, null, and *is*. If *will execute script* is true, set the *synchronous custom elements flag*; otherwise, leave it unset.

#### Note

*This will cause [custom element constructors](#)<sup>p759</sup> to run, if *will execute script* is true. However, since we incremented the [throw-on-dynamic-markup-insertion counter](#)<sup>p1150</sup>, this cannot cause [new characters to be inserted into the tokenizer](#)<sup>p1153</sup>, or the document to be blown away<sup>p1151</sup>.*

10. [Append](#) each attribute in the given token to *element*.

#### Note

This can [enqueue a custom element callback reaction](#)<sup>p769</sup> for the `attributeChangedCallback`, which might run immediately (in the next step).

#### Note

Even though the `is`<sup>p759</sup> attribute governs the [creation of a customized built-in element](#)<sup>p759</sup>, it is not present during the execution of the relevant [custom element constructor](#)<sup>p759</sup>; it is appended in this step, along with all other attributes.

11. If *will execute script* is true, then:
  1. Let *queue* be the result of popping from *document*'s [relevant agent](#)<sup>p1073</sup>'s [custom element reactions stack](#)<sup>p768</sup>. (This will be the same [element queue](#)<sup>p768</sup> as was pushed above.)
  2. [Invoke custom element reactions](#)<sup>p769</sup> in *queue*.
  3. Decrement *document*'s [throw-on-dynamic-markup-insertion counter](#)<sup>p1150</sup>.
12. If *element* has an `xmlns` attribute in the [XMLNS namespace](#) whose value is not exactly the same as the element's namespace, that is a [parse error](#)<sup>p1273</sup>. Similarly, if *element* has an `xmlns:xlink` attribute in the [XMLNS namespace](#) whose value is not the [XLink Namespace](#), that is a [parse error](#)<sup>p1273</sup>.
13. If *element* is a [resettable element](#)<sup>p514</sup>, invoke its [reset algorithm](#)<sup>p637</sup>. (This initializes the element's [value](#)<sup>p597</sup> and [checkedness](#)<sup>p597</sup> based on the element's attributes.)
14. If *element* is a [form-associated element](#)<sup>p513</sup> and not a [form-associated custom element](#)<sup>p760</sup>, the [form element pointer](#)<sup>p1289</sup> is not null, there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, *element* is either not [listed](#)<sup>p513</sup> or doesn't have a [form](#)<sup>p598</sup> attribute, and the *intended parent* is in the same *tree* as the element pointed to by the [form element pointer](#)<sup>p1289</sup>, then [associate](#)<sup>p598</sup> *element* with the [form](#)<sup>p514</sup> element pointed to by the [form element pointer](#)<sup>p1289</sup> and set *element*'s [parser inserted flag](#)<sup>p598</sup>.
15. Return *element*.

To **insert an element at the adjusted insertion location** with an element *element*:

1. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1319</sup>.
2. If it is not possible to insert *element* at the *adjusted insertion location*, abort these steps.
3. If the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup>, then push a new [element queue](#)<sup>p768</sup> onto *element*'s [relevant agent](#)<sup>p1073</sup>'s [custom element reactions stack](#)<sup>p768</sup>.
4. Insert *element* at the *adjusted insertion location*.
5. If the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup>, then pop the [element queue](#)<sup>p768</sup> from *element*'s [relevant agent](#)<sup>p1073</sup>'s [custom element reactions stack](#)<sup>p768</sup>, and [invoke custom element reactions](#)<sup>p769</sup> in that queue.

#### Note

If the adjusted insertion location cannot accept more elements, e.g., because it's a [Document](#)<sup>p139</sup> that already has an element child, then *element* is dropped on the floor.

When the steps below require the user agent to **insert a foreign element** for a token in a given namespace and with a boolean *onlyAddToElementStack*, the user agent must run these steps:

1. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1319</sup>.
2. Let *element* be the result of [creating an element for the token](#)<sup>p1320</sup> in the given namespace, with the intended parent being the element in which the *adjusted insertion location* finds itself.
3. If *onlyAddToElementStack* is false, then run [insert an element at the adjusted insertion location](#)<sup>p1321</sup> with *element*.
4. Push *element* onto the [stack of open elements](#)<sup>p1286</sup> so that it is the new [current node](#)<sup>p1286</sup>.
5. Return *element*.

When the steps below require the user agent to **insert an HTML element** for a token, the user agent must [insert a foreign](#)

[element<sup>p1321</sup>](#) for the token, with the [HTML namespace](#) and false.

When the steps below require the user agent to **adjust MathML attributes** for a token, then, if the token has an attribute named `definitionurl`, change its name to `definitionURL` (note the case difference).

When the steps below require the user agent to **adjust SVG attributes** for a token, then, for each attribute on the token whose attribute name is one of the ones in the first column of the following table, change the attribute's name to the name given in the corresponding cell in the second column. (This fixes the case of SVG attributes that are not all lowercase.)

Attribute name on token	Attribute name on element
<code>attributename</code>	<code>attributeName</code>
<code>attributetype</code>	<code>attributeType</code>
<code>basefrequency</code>	<code>baseFrequency</code>
<code>baseprofile</code>	<code>baseProfile</code>
<code>calcmode</code>	<code>calcMode</code>
<code>clippathunits</code>	<code>clipPathUnits</code>
<code>diffuseconstant</code>	<code>diffuseConstant</code>

<code>specularexponent</code>	<code>specularExponent</code>
<code>spreadmethod</code>	<code>spreadMethod</code>
<code>startoffset</code>	<code>startOffset</code>
<code>stddeviation</code>	<code>stdDeviation</code>
<code>stitchtiles</code>	<code>stitchTiles</code>

Attribute name on token	Attribute name on element
surfacescale	surfaceScale
systemlanguage	systemLanguage
tablevalues	tableValues
targetx	targetX
targety	targetY
textlength	textLength
viewbox	viewBox
viewtarget	viewTarget
xchannelselector	xChannelSelector
ychannelselector	yChannelSelector
zoomandpan	zoomAndPan

When the steps below require the user agent to **adjust foreign attributes** for a token, then, if any of the attributes on the token match the strings given in the first column of the following table, let the attribute be a namespaced attribute, with the prefix being the string given in the corresponding cell in the second column, the local name being the string given in the corresponding cell in the third column, and the namespace being the namespace given in the corresponding cell in the fourth column. (This fixes the use of namespaced attributes, in particular [lang attributes in the XML namespace](#).)

Attribute name	Prefix	Local name	Namespace
xlink:actuate	xlink	actuate	<a href="#">XLink namespace</a>
xlink:arcrole	xlink	arcrole	<a href="#">XLink namespace</a>
xlink:href	xlink	href	<a href="#">XLink namespace</a>
xlink:role	xlink	role	<a href="#">XLink namespace</a>
xlink:show	xlink	show	<a href="#">XLink namespace</a>
xlink:title	xlink	title	<a href="#">XLink namespace</a>
xlink:type	xlink	type	<a href="#">XLink namespace</a>
xml:lang	xml	lang	<a href="#">XML namespace</a>
xml:space	xml	space	<a href="#">XML namespace</a>
xmlns	(none)	xmlns	<a href="#">XMLNS namespace</a>
xmlns:xlink	xmlns	xlink	<a href="#">XMLNS namespace</a>

When the steps below require the user agent to **insert a character** while processing a token, the user agent must run the following steps:

1. Let *data* be the characters passed to the algorithm, or, if no characters were explicitly specified, the character of the character token being processed.
2. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1319</sup>.
3. If the *adjusted insertion location* is in a [Document](#)<sup>p130</sup> node, then return.

#### Note

The DOM will not let [Document](#)<sup>p130</sup> nodes have [Text](#) node children, so they are dropped on the floor.

4. If there is a [Text](#) node immediately before the *adjusted insertion location*, then append *data* to that [Text](#) node's *data*.

Otherwise, create a new [Text](#) node whose *data* is *data* and whose *node document* is the same as that of the element in which the *adjusted insertion location* finds itself, and insert the newly created node at the *adjusted insertion location*.

#### Example

Here are some sample inputs to the parser and the corresponding number of [Text](#) nodes that they result in, assuming a user agent that executes scripts.

Input	Number of <a href="#">Text</a> nodes
<pre>A&lt;script&gt; var script = document.getElementsByTagName('script')[0]; document.body.removeChild(script);</pre>	One <a href="#">Text</a> node in the document, containing "AB".

Input	Number of <b>Text</b> nodes
<code>&lt;/script&gt;B</code>	
<code>A&lt;script&gt; var text = document.createTextNode('B'); document.body.appendChild(text); &lt;/script&gt;C</code>	Three <b>Text</b> nodes; "A" before the script, the script's contents, and "BC" after the script (the parser appends to the <b>Text</b> node created by the script).
<code>A&lt;script&gt; var text = document.getElementsByTagName('script')[0].firstChild; text.data = 'B'; document.body.appendChild(text); &lt;/script&gt;C</code>	Two adjacent <b>Text</b> nodes in the document, containing "A" and "BC".
<code>A&lt;table&gt;B&lt;tr&gt;C&lt;/tr&gt;D&lt;/table&gt;</code>	One <b>Text</b> node before the table, containing "ABCD". (This is caused by <a href="#">foster parenting</a> <sup>p1319</sup> .)
<code>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; C&lt;/table&gt;</code>	One <b>Text</b> node before the table, containing "A B C" (A-space-B-space-C). (This is caused by <a href="#">foster parenting</a> <sup>p1319</sup> .)
<code>A&lt;table&gt;&lt;tr&gt; B&lt;/tr&gt; &lt;/em&gt;C&lt;/table&gt;</code>	One <b>Text</b> node before the table, containing "A BC" (A-space-B-C), and one <b>Text</b> node inside the table (as a child of a <a href="#">tbody</a> <sup>p489</sup> ) with a single space character. (Space characters separated from non-space characters by non-character tokens are not affected by <a href="#">foster parenting</a> <sup>p1319</sup> , even if those other tokens then get ignored.)

When the steps below require the user agent to **insert a comment** while processing a comment token, optionally with an explicitly insertion position *position*, the user agent must run the following steps:

1. Let *data* be the data given in the comment token being processed.
2. If *position* was specified, then let the *adjusted insertion location* be *position*. Otherwise, let *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1319</sup>.
3. Create a **Comment** node whose *data* attribute is set to *data* and whose [node document](#) is the same as that of the node in which the *adjusted insertion location* finds itself.
4. Insert the newly created node at the *adjusted insertion location*.

### 13.2.6.2 Parsing elements that contain only text §<sup>p13</sup> 24

The **generic raw text element parsing algorithm** and the **generic RCDATA element parsing algorithm** consist of the following steps. These algorithms are always invoked in response to a start tag token.

1. [Insert an HTML element](#)<sup>p1321</sup> for the token.
2. If the algorithm that was invoked is the [generic raw text element parsing algorithm](#)<sup>p1324</sup>, switch the tokenizer to the [RAWTEXT state](#)<sup>p1291</sup>; otherwise the algorithm invoked was the [generic RCDATA element parsing algorithm](#)<sup>p1324</sup>, switch the tokenizer to the [RCDATA state](#)<sup>p1291</sup>.
3. Let the [original insertion mode](#)<sup>p1285</sup> be the current [insertion mode](#)<sup>p1285</sup>.
4. Then, switch the [insertion mode](#)<sup>p1285</sup> to "[text](#)<sup>p1342</sup>".

### 13.2.6.3 Closing elements that have implied end tags §<sup>p13</sup> 24

When the steps below require the UA to **generate implied end tags**, then, while the [current node](#)<sup>p1286</sup> is a [dd](#)<sup>p248</sup> element, a [dt](#)<sup>p247</sup> element, an [li](#)<sup>p241</sup> element, an [optgroup](#)<sup>p576</sup> element, an [option](#)<sup>p577</sup> element, a [p](#)<sup>p229</sup> element, an [rb](#)<sup>p1427</sup> element, an [rp](#)<sup>p277</sup> element, an [rt](#)<sup>p277</sup> element, or an [rtc](#)<sup>p1427</sup> element, the UA must pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

If a step requires the UA to generate implied end tags but lists an element to exclude from the process, then the UA must perform the above steps as if that element was not in the above list.

When the steps below require the UA to **generate all implied end tags thoroughly**, then, while the [current node](#)<sup>p1286</sup> is a [caption](#)<sup>p486</sup> element, a [colgroup](#)<sup>p487</sup> element, a [dd](#)<sup>p248</sup> element, a [dt](#)<sup>p247</sup> element, an [li](#)<sup>p241</sup> element, an [optgroup](#)<sup>p576</sup> element, an [option](#)<sup>p577</sup> element, a [p](#)<sup>p229</sup> element, an [rb](#)<sup>p1427</sup> element, an [rp](#)<sup>p277</sup> element, an [rt](#)<sup>p277</sup> element, an [rtc](#)<sup>p1427</sup> element, a [tbody](#)<sup>p489</sup> element, a [td](#)<sup>p493</sup> element, a [tfoot](#)<sup>p491</sup> element, a [th](#)<sup>p495</sup> element, a [thead](#)<sup>p490</sup> element, or a [tr](#)<sup>p492</sup> element, the UA must pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

### 13.2.6.4 The rules for parsing tokens in HTML content <sup>p13</sup><sub>25</sub>

#### 13.2.6.4.1 The "initial" insertion mode <sup>p13</sup><sub>25</sub>

A [Document](#)<sup>p130</sup> object has an associated **parser cannot change the mode flag** (a boolean). It is initially false.

When the user agent is to apply the rules for the ["initial"](#)<sup>p1325</sup> [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup> as the last child of the [Document](#)<sup>p130</sup> object.

↪ **A DOCTYPE token**

If the DOCTYPE token's name is not "html", or the token's public identifier is not missing, or the token's system identifier is neither missing nor ["about:legacy-compat"](#)<sup>p96</sup>, then there is a [parse error](#)<sup>p1273</sup>.

Append a [DocumentType](#) node to the [Document](#)<sup>p130</sup> node, with its [name](#) set to the name given in the DOCTYPE token, or the empty string if the name was missing; its [public ID](#) set to the public identifier given in the DOCTYPE token, or the empty string if the public identifier was missing; and its [system ID](#) set to the system identifier given in the DOCTYPE token, or the empty string if the system identifier was missing.

#### Note

*This also ensures that the [DocumentType](#) node is returned as the value of the [doctype](#) attribute of the [Document](#)<sup>p130</sup> object.*

Then, if the document is *not* an [iframe srcdoc document](#)<sup>p391</sup>, and the [parser cannot change the mode flag](#)<sup>p1325</sup> is false, and the DOCTYPE token matches one of the conditions in the following list, then set the [Document](#)<sup>p130</sup> to [quirks mode](#):

- The [force-quirks flag](#)<sup>p1290</sup> is set to on.
- The name is not "html".
- The public identifier is set to: "-//W3O//DTD W3 HTML Strict 3.0//EN/"
- The public identifier is set to: "-//W3C//DTD HTML 4.0 Transitional//EN"
- The public identifier is set to: "HTML"
- The system identifier is set to: "http://www.ibm.com/data/dtd/v11/ibmhtml1-transitional.dtd"
- The public identifier starts with: "+//Silmaril//dtd html Pro v0r11 19970101//"
- The public identifier starts with: "-//AS//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//AdvaSoft Ltd//DTD HTML 3.0 asWedit + extensions//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0 Strict//"
- The public identifier starts with: "-//IETF//DTD HTML 2.0//"
- The public identifier starts with: "-//IETF//DTD HTML 2.1E//"
- The public identifier starts with: "-//IETF//DTD HTML 3.0//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2 Final//"
- The public identifier starts with: "-//IETF//DTD HTML 3.2//"
- The public identifier starts with: "-//IETF//DTD HTML 3//"
- The public identifier starts with: "-//IETF//DTD HTML Level 0//"
- The public identifier starts with: "-//IETF//DTD HTML Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 0//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 1//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 2//"
- The public identifier starts with: "-//IETF//DTD HTML Strict Level 3//"
- The public identifier starts with: "-//IETF//DTD HTML Strict//"

- The public identifier starts with: "-//IETF//DTD HTML//"
- The public identifier starts with: "-//Metrius//DTD Metrius Presentational//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 2.0 Tables//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML Strict//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 HTML//"
- The public identifier starts with: "-//Microsoft//DTD Internet Explorer 3.0 Tables//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD HTML//"
- The public identifier starts with: "-//Netscape Comm. Corp.//DTD Strict HTML//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML 2.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended 1.0//"
- The public identifier starts with: "-//O'Reilly and Associates//DTD HTML Extended Relaxed 1.0//"
- The public identifier starts with: "-//SQ//DTD HTML 2.0 HoTMetal + extensions//"
- The public identifier starts with: "-//SoftQuad Software//DTD HoTMetal PRO 6.0::19990601::extensions to HTML 4.0//"
- The public identifier starts with: "-//SoftQuad//DTD HoTMetal PRO 4.0::19971010::extensions to HTML 4.0//"
- The public identifier starts with: "-//Spyglass//DTD HTML 2.0 Extended//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava HTML//"
- The public identifier starts with: "-//Sun Microsystems Corp.//DTD HotJava Strict HTML//"
- The public identifier starts with: "-//W3C//DTD HTML 3 1995-03-24//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2 Final//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2//"
- The public identifier starts with: "-//W3C//DTD HTML 3.2S Draft//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD HTML 4.0 Transitional//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 19960712//"
- The public identifier starts with: "-//W3C//DTD HTML Experimental 970421//"
- The public identifier starts with: "-//W3C//DTD W3 HTML//"
- The public identifier starts with: "-//W30//DTD W3 HTML 3.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML 2.0//"
- The public identifier starts with: "-//WebTechs//DTD Mozilla HTML//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

Otherwise, if the document is *not* an [iframe srcdoc document](#)<sup>p391</sup>, and the [parser cannot change the mode flag](#)<sup>p1325</sup> is false, and the DOCTYPE token matches one of the conditions in the following list, then set the [Document](#)<sup>p130</sup> to [limited-quirks mode](#):

- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Frameset//"
- The public identifier starts with: "-//W3C//DTD XHTML 1.0 Transitional//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Frameset//"
- The system identifier is not missing and the public identifier starts with: "-//W3C//DTD HTML 4.01 Transitional//"

The system identifier and public identifier strings must be compared to the values given in the lists above in an [ASCII case-insensitive](#) manner. A system identifier whose value is the empty string is not considered missing for the purposes of the conditions above.

Then, switch the [insertion mode](#)<sup>p1285</sup> to "[before html](#)<sup>p1326</sup>".

#### ↪ Anything else

If the document is *not* an [iframe srcdoc document](#)<sup>p391</sup>, then this is a [parse error](#)<sup>p1273</sup>; if the [parser cannot change the mode flag](#)<sup>p1325</sup> is false, set the [Document](#)<sup>p130</sup> to [quirks mode](#).

In any case, switch the [insertion mode](#)<sup>p1285</sup> to "[before html](#)<sup>p1326</sup>", then reprocess the token.

### 13.2.6.4.2 The "[before html](#)" insertion mode <sup>§ p13</sup><sub>26</sub>

When the user agent is to apply the rules for the "[before html](#)<sup>p1326</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

#### ↪ A DOCTYPE token

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ A comment token

[Insert a comment](#)<sup>p1324</sup> as the last child of the [Document](#)<sup>p130</sup> object.

#### ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

Ignore the token.

↪ **A start tag whose tag name is "html"**

Create an [element for the token](#)<sup>p1320</sup> in the [HTML namespace](#), with the [Document](#)<sup>p130</sup> as the intended parent. Append it to the [Document](#)<sup>p130</sup> object. Put this element in the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[before head](#)<sup>p1327</sup>".

↪ **An end tag whose tag name is one of: "head", "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Anything else**

Create an [html](#)<sup>p172</sup> element whose [node document](#) is the [Document](#)<sup>p130</sup> object. Append it to the [Document](#)<sup>p130</sup> object. Put this element in the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[before head](#)<sup>p1327</sup>", then reprocess the token.

The [document element](#) can end up being removed from the [Document](#)<sup>p130</sup> object, e.g. by scripts; nothing in particular happens in such cases, content continues being appended to the nodes as described in the next section.

### 13.2.6.4.3 The "[before head](#)" insertion mode §<sup>p13</sup> 27

When the user agent is to apply the rules for the "[before head](#)<sup>p1327</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Ignore the token.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is "head"**

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Set the [head element pointer](#)<sup>p1289</sup> to the newly created [head](#)<sup>p173</sup> element.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in head](#)<sup>p1328</sup>".

↪ **An end tag whose tag name is one of: "head", "body", "html", "br"**

Act as described in the "anything else" entry below.

↪ **Any other end tag**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Anything else**

[Insert an HTML element](#)<sup>p1321</sup> for a "head" start tag token with no attributes.

Set the [head element pointer](#)<sup>p1289</sup> to the newly created [head](#)<sup>p173</sup> element.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in head](#)<sup>p1328</sup>".

Reprocess the current token.

#### 13.2.6.4.4 The "in head" insertion mode <sup>p13</sup><sub>28</sub>

When the user agent is to apply the rules for the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character](#)<sup>p1323</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link"**

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

↪ **A start tag whose tag name is "meta"**

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

If the [active speculative HTML parser](#)<sup>p1360</sup> is null, then:

1. If the element has a [charset](#)<sup>p190</sup> attribute, and [getting an encoding](#) from its value results in an [encoding](#), and the [confidence](#)<sup>p1278</sup> is currently *tentative*, then [change the encoding](#)<sup>p1284</sup> to the resulting encoding.
2. Otherwise, if the element has an [http-equiv](#)<sup>p195</sup> attribute whose value is an [ASCII case-insensitive](#) match for the string "Content-Type", and the element has a [content](#)<sup>p199</sup> attribute, and applying the [algorithm for extracting a character encoding from a meta element](#)<sup>p99</sup> to that attribute's value returns an [encoding](#), and the [confidence](#)<sup>p1278</sup> is currently *tentative*, then [change the encoding](#)<sup>p1284</sup> to the extracted encoding.

#### Note

The [speculative HTML parser](#)<sup>p1360</sup> doesn't speculatively apply character encoding declarations in order to reduce implementation complexity.

↪ **A start tag whose tag name is "title"**

Follow the [generic RCDATA element parsing algorithm](#)<sup>p1324</sup>.

↪ **A start tag whose tag name is "noscript", if the [scripting flag](#)<sup>p1289</sup> is enabled**

↪ **A start tag whose tag name is one of: "noframes", "style"**

Follow the [generic raw text element parsing algorithm](#)<sup>p1324</sup>.

↪ **A start tag whose tag name is "noscript", if the [scripting flag](#)<sup>p1289</sup> is disabled**

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in head noscript](#)<sup>p1330</sup>".

↪ **A start tag whose tag name is "script"**

Run these steps:

1. Let the *adjusted insertion location* be the [appropriate place for inserting a node](#)<sup>p1319</sup>.
2. [Create an element for the token](#)<sup>p1320</sup> in the [HTML namespace](#), with the intended parent being the element in which the *adjusted insertion location* finds itself.
3. Set the element's [parser document](#)<sup>p659</sup> to the [Document](#)<sup>p138</sup>, and set the element's [force async](#)<sup>p659</sup> to false.

#### Note

This ensures that, if the script is external, any `document.write()` <sup>p1153</sup> calls in the script will execute in-line, instead of blowing the document away, as would happen in most other cases. It also prevents the script from executing until the end tag is seen.

4. If the parser was created as part of the [HTML fragment parsing algorithm](#) <sup>p1373</sup>, then set the `script` <sup>p652</sup> element's `already started` <sup>p659</sup> to true. ([fragment case](#) <sup>p1373</sup>)
5. If the parser was invoked via the `document.write()` <sup>p1153</sup> or `document.writeln()` <sup>p1153</sup> methods, then optionally set the `script` <sup>p652</sup> element's `already started` <sup>p659</sup> to true. (For example, the user agent might use this clause to prevent execution of [cross-origin](#) <sup>p898</sup> scripts inserted via `document.write()` <sup>p1153</sup> under slow network conditions, or when the page has already taken a long time to load.)
6. Insert the newly created element at the *adjusted insertion location*.
7. Push the element onto the [stack of open elements](#) <sup>p1286</sup> so that it is the new [current node](#) <sup>p1286</sup>.
8. Switch the tokenizer to the [script data state](#) <sup>p1291</sup>.
9. Let the [original insertion mode](#) <sup>p1285</sup> be the current [insertion mode](#) <sup>p1285</sup>.
10. Switch the [insertion mode](#) <sup>p1285</sup> to "[text](#)" <sup>p1342</sup>.

#### ↪ An end tag whose tag name is "head"

Pop the [current node](#) <sup>p1286</sup> (which will be the `head` <sup>p173</sup> element) off the [stack of open elements](#) <sup>p1286</sup>.

Switch the [insertion mode](#) <sup>p1285</sup> to "[after head](#)" <sup>p1331</sup>.

#### ↪ An end tag whose tag name is one of: "body", "html", "br"

Act as described in the "anything else" entry below.

#### ↪ A start tag whose tag name is "template"

Let *template start tag* be the start tag.

Insert a [marker](#) <sup>p1288</sup> at the end of the [list of active formatting elements](#) <sup>p1288</sup>.

Set the [frameset-ok flag](#) <sup>p1290</sup> to "not ok".

Switch the [insertion mode](#) <sup>p1285</sup> to "[in template](#)" <sup>p1352</sup>.

Push "[in template](#)" <sup>p1352</sup> onto the [stack of template insertion modes](#) <sup>p1285</sup> so that it is the new [current template insertion mode](#) <sup>p1285</sup>.

Let the *adjusted insertion location* be the [appropriate place for inserting a node](#) <sup>p1319</sup>.

Let *intended parent* be the element in which the *adjusted insertion location* finds itself.

Let *document* be *intended parent*'s [node document](#).

If any of the following are false:

- *template start tag*'s `shadowrootmode` <sup>p672</sup> is not in the [none](#) <sup>p672</sup> state;
- *document*'s [allow declarative shadow roots](#) is true; or
- the [adjusted current node](#) <sup>p1287</sup> is not the topmost element in the [stack of open elements](#) <sup>p1286</sup>,

then [insert an HTML element](#) <sup>p1321</sup> for the token.

Otherwise:

1. Let *declarative shadow host element* be [adjusted current node](#) <sup>p1287</sup>.
2. Let *template* be the result of [insert a foreign element](#) <sup>p1321</sup> for *template start tag*, with [HTML namespace](#) and true.
3. Let *mode* be *template start tag*'s `shadowrootmode` <sup>p672</sup> attribute's value.
4. Let *clonable* be true if *template start tag* has a `shadowrootclonable` <sup>p672</sup> attribute; otherwise false.

5. Let *serializable* be true if *template start tag* has a [shadowrootserializable](#)<sup>p672</sup> attribute; otherwise false.
6. Let *delegatesFocus* be true if *template start tag* has a [shadowrootdelegatesfocus](#)<sup>p672</sup> attribute; otherwise false.
7. If *declarative shadow host element* is a [shadow host](#), then [insert an element at the adjusted insertion location](#)<sup>p1321</sup> with *template*.
8. Otherwise:
  1. [Attach a shadow root](#) with *declarative shadow host element*, *mode*, *clonable*, *serializable*, *delegatesFocus*, and "named".

If an exception is thrown, then catch it and:

1. [Insert an element at the adjusted insertion location](#)<sup>p1321</sup> with *template*.
2. The user agent may report an error to the developer console.
3. Return.
2. Let *shadow* be *declarative shadow host element*'s [shadow root](#).
3. Set *shadow*'s [declarative](#) to true.
4. Set [template](#)<sup>p671</sup>'s [template contents](#)<sup>p673</sup> property to *shadow*.
5. Set *shadow*'s [available to element internals](#) to true.

#### ↪ An end tag whose tag name is "template"

If there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate all implied end tags thoroughly](#)<sup>p1325</sup>.
2. If the [current node](#)<sup>p1286</sup> is not a [template](#)<sup>p671</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [template](#)<sup>p671</sup> element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p1289</sup>.
5. Pop the [current template insertion mode](#)<sup>p1285</sup> off the [stack of template insertion modes](#)<sup>p1285</sup>.
6. [Reset the insertion mode appropriately](#)<sup>p1285</sup>.

#### ↪ A start tag whose tag name is "head"

#### ↪ Any other end tag

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ Anything else

Pop the [current node](#)<sup>p1286</sup> (which will be the [head](#)<sup>p173</sup> element) off the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[after head](#)<sup>p1331</sup>".

Reprocess the token.

### 13.2.6.4.5 The "in head noscript" insertion mode §<sup>p13</sup> 30

When the user agent is to apply the rules for the "[in head noscript](#)<sup>p1330</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

#### ↪ A DOCTYPE token

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ A start tag whose tag name is "html"

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **An end tag whose tag name is "noscript"**

Pop the [current node](#)<sup>p1286</sup> (which will be a [noscript](#)<sup>p669</sup> element) from the [stack of open elements](#)<sup>p1286</sup>; the new [current node](#)<sup>p1286</sup> will be a [head](#)<sup>p173</sup> element.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in head](#)<sup>p1328</sup>".

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

↪ **A comment token**

↪ **A start tag whose tag name is one of: "basefont", "bgsound", "link", "meta", "noframes", "style"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **An end tag whose tag name is "br"**

Act as described in the "anything else" entry below.

↪ **A start tag whose tag name is one of: "head", "noscript"**

↪ **Any other end tag**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Anything else**

[Parse error](#)<sup>p1273</sup>.

Pop the [current node](#)<sup>p1286</sup> (which will be a [noscript](#)<sup>p669</sup> element) from the [stack of open elements](#)<sup>p1286</sup>; the new [current node](#)<sup>p1286</sup> will be a [head](#)<sup>p173</sup> element.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in head](#)<sup>p1328</sup>".

Reprocess the token.

#### 13.2.6.4.6 The "after head" insertion mode <sup>§<sup>p13</sup> 31</sup>

When the user agent is to apply the rules for the "[after head](#)<sup>p1331</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character](#)<sup>p1323</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is "body"**

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

Switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>".

↪ **A start tag whose tag name is "frameset"**

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in frameset](#)<sup>p1354</sup>".

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"**

[Parse error](#)<sup>p1273</sup>.

Push the node pointed to by the [head element pointer](#)<sup>p1289</sup> onto the [stack of open elements](#)<sup>p1286</sup>.

Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.

Remove the node pointed to by the [head element pointer](#)<sup>p1289</sup> from the [stack of open elements](#)<sup>p1286</sup>. (It might not be the [current node](#)<sup>p1286</sup> at this point.)

#### Note

*The [head element pointer](#)<sup>p1289</sup> cannot be null at this point.*

#### ↪ An end tag whose tag name is "template"

Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.

#### ↪ An end tag whose tag name is one of: "body", "html", "br"

Act as described in the "anything else" entry below.

#### ↪ A start tag whose tag name is "head"

#### ↪ Any other end tag

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ Anything else

[Insert an HTML element](#)<sup>p1321</sup> for a "body" start tag token with no attributes.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>".

Reprocess the current token.

### 13.2.6.4.7 The "[in body](#)" [insertion mode](#) §<sup>p13</sup> 32

When the user agent is to apply the rules for the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

#### ↪ A character token that is U+0000 NULL

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Insert the token's character](#)<sup>p1323</sup>.

#### ↪ Any other character token

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Insert the token's character](#)<sup>p1323</sup>.

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

#### ↪ A comment token

[Insert a comment](#)<sup>p1324</sup>.

#### ↪ A DOCTYPE token

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### ↪ A start tag whose tag name is "html"

[Parse error](#)<sup>p1273</sup>.

If there is a [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then ignore the token.

Otherwise, for each attribute on the token, check to see if the attribute is already present on the top element of the [stack of open elements](#)<sup>p1286</sup>. If it is not, add the attribute and its corresponding value to that element.

↪ A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"

↪ An end tag whose tag name is "template"

Process the token using the rules for<sup>p1285</sup> the "in head<sup>p1328</sup>" insertion mode<sup>p1285</sup>.

↪ A start tag whose tag name is "body"

Parse error<sup>p1273</sup>.

If the stack of open elements<sup>p1286</sup> has only one node on it, if the second element on the stack of open elements<sup>p1286</sup> is not a body<sup>p205</sup> element, or if there is a template<sup>p671</sup> element on the stack of open elements<sup>p1286</sup>, then ignore the token. (fragment case<sup>p1373</sup> or there is a template<sup>p671</sup> element on the stack)

Otherwise, set the frameset-ok flag<sup>p1290</sup> to "not ok"; then, for each attribute on the token, check to see if the attribute is already present on the body<sup>p205</sup> element (the second element) on the stack of open elements<sup>p1286</sup>, and if it is not, add the attribute and its corresponding value to that element.

↪ A start tag whose tag name is "frameset"

Parse error<sup>p1273</sup>.

If the stack of open elements<sup>p1286</sup> has only one node on it, or if the second element on the stack of open elements<sup>p1286</sup> is not a body<sup>p205</sup> element, then ignore the token. (fragment case<sup>p1373</sup> or there is a template<sup>p671</sup> element on the stack)

If the frameset-ok flag<sup>p1290</sup> is set to "not ok", ignore the token.

Otherwise, run the following steps:

1. Remove the second element on the stack of open elements<sup>p1286</sup> from its parent node, if it has one.
2. Pop all the nodes from the bottom of the stack of open elements<sup>p1286</sup>, from the current node<sup>p1286</sup> up to, but not including, the root html<sup>p172</sup> element.
3. Insert an HTML element<sup>p1321</sup> for the token.
4. Switch the insertion mode<sup>p1285</sup> to "in frameset<sup>p1354</sup>".

↪ An end-of-file token

If the stack of template insertion modes<sup>p1285</sup> is not empty, then process the token using the rules for<sup>p1285</sup> the "in template<sup>p1352</sup>" insertion mode<sup>p1285</sup>.

Otherwise, follow these steps:

1. If there is a node in the stack of open elements<sup>p1286</sup> that is not either a dd<sup>p248</sup> element, a dt<sup>p247</sup> element, an li<sup>p241</sup> element, an optgroup<sup>p576</sup> element, an option<sup>p577</sup> element, a p<sup>p229</sup> element, an rb<sup>p1427</sup> element, an rp<sup>p277</sup> element, an rt<sup>p277</sup> element, an rtc<sup>p1427</sup> element, a tbody<sup>p489</sup> element, a td<sup>p493</sup> element, a tfoot<sup>p491</sup> element, a th<sup>p495</sup> element, a thead<sup>p490</sup> element, a tr<sup>p492</sup> element, the body<sup>p205</sup> element, or the html<sup>p172</sup> element, then this is a parse error<sup>p1273</sup>.
2. Stop parsing<sup>p1358</sup>.

↪ An end tag whose tag name is "body"

If the stack of open elements<sup>p1286</sup> does not have a body element in scope<sup>p1287</sup>, this is a parse error<sup>p1273</sup>; ignore the token.

Otherwise, if there is a node in the stack of open elements<sup>p1286</sup> that is not either a dd<sup>p248</sup> element, a dt<sup>p247</sup> element, an li<sup>p241</sup> element, an optgroup<sup>p576</sup> element, an option<sup>p577</sup> element, a p<sup>p229</sup> element, an rb<sup>p1427</sup> element, an rp<sup>p277</sup> element, an rt<sup>p277</sup> element, an rtc<sup>p1427</sup> element, a tbody<sup>p489</sup> element, a td<sup>p493</sup> element, a tfoot<sup>p491</sup> element, a th<sup>p495</sup> element, a thead<sup>p490</sup> element, a tr<sup>p492</sup> element, the body<sup>p205</sup> element, or the html<sup>p172</sup> element, then this is a parse error<sup>p1273</sup>.

Switch the insertion mode<sup>p1285</sup> to "after body<sup>p1353</sup>".

↪ An end tag whose tag name is "html"

If the stack of open elements<sup>p1286</sup> does not have a body element in scope<sup>p1287</sup>, this is a parse error<sup>p1273</sup>; ignore the token.

Otherwise, if there is a node in the stack of open elements<sup>p1286</sup> that is not either a dd<sup>p248</sup> element, a dt<sup>p247</sup> element, an li<sup>p241</sup> element, an optgroup<sup>p576</sup> element, an option<sup>p577</sup> element, a p<sup>p229</sup> element, an rb<sup>p1427</sup> element, an rp<sup>p277</sup> element, an rt<sup>p277</sup> element, an rtc<sup>p1427</sup> element, a tbody<sup>p489</sup> element, a td<sup>p493</sup> element, a tfoot<sup>p491</sup> element, a th<sup>p495</sup> element, a thead<sup>p490</sup> element, a tr<sup>p492</sup> element, the body<sup>p205</sup> element, or the html<sup>p172</sup> element, then this is a parse error<sup>p1273</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[after body](#)<sup>p1353</sup>".

Reprocess the token.

↪ **A start tag whose tag name is one of:** "address", "article", "aside", "blockquote", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "main", "menu", "nav", "ol", "p", "search", "section", "summary", "ul"

If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

↪ **A start tag whose tag name is one of:** "h1", "h2", "h3", "h4", "h5", "h6"

If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

If the [current node](#)<sup>p1286</sup> is an [HTML element](#)<sup>p45</sup> whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a [parse error](#)<sup>p1273</sup>; pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

↪ **A start tag whose tag name is one of:** "pre", "listing"

If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

If the [next token](#)<sup>p1318</sup> is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one. (Newlines at the start of [pre](#)<sup>p233</sup> blocks are ignored as an authoring convenience.)

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **A start tag whose tag name is "form"**

If the [form element pointer](#)<sup>p1289</sup> is not null, and there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token, and, if there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, set the [form element pointer](#)<sup>p1289</sup> to point to the element created.

↪ **A start tag whose tag name is "li"**

Run these steps:

1. Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".
2. Initialize *node* to be the [current node](#)<sup>p1286</sup> (the bottommost node of the stack).
3. *Loop*: If *node* is an [li](#)<sup>p241</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1324</sup>, except for [li](#)<sup>p241</sup> elements.
  2. If the [current node](#)<sup>p1286</sup> is not an [li](#)<sup>p241</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until an [li](#)<sup>p241</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
4. If *node* is in the [special](#)<sup>p1287</sup> category, but is not an [address](#)<sup>p222</sup>, [div](#)<sup>p256</sup>, or [p](#)<sup>p229</sup> element, then jump to the step labeled *done* below.
5. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p1286</sup> and return to the step labeled *loop*.
6. *Done*: If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.
7. Finally, [insert an HTML element](#)<sup>p1321</sup> for the token.

↪ **A start tag whose tag name is one of: "dd", "dt"**

Run these steps:

1. Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".
2. Initialize *node* to be the [current node](#)<sup>p1286</sup> (the bottommost node of the stack).
3. *Loop*: If *node* is a [dd](#)<sup>p248</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1324</sup>, except for [dd](#)<sup>p248</sup> elements.
  2. If the [current node](#)<sup>p1286</sup> is not a [dd](#)<sup>p248</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [dd](#)<sup>p248</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
4. If *node* is a [dt](#)<sup>p247</sup> element, then run these substeps:
  1. [Generate implied end tags](#)<sup>p1324</sup>, except for [dt](#)<sup>p247</sup> elements.
  2. If the [current node](#)<sup>p1286</sup> is not a [dt](#)<sup>p247</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [dt](#)<sup>p247</sup> element has been popped from the stack.
  4. Jump to the step labeled *done* below.
5. If *node* is in the [special](#)<sup>p1287</sup> category, but is not an [address](#)<sup>p222</sup>, [div](#)<sup>p256</sup>, or [p](#)<sup>p229</sup> element, then jump to the step labeled *done* below.
6. Otherwise, set *node* to the previous entry in the [stack of open elements](#)<sup>p1286</sup> and return to the step labeled *loop*.
7. *Done*: If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.
8. Finally, [insert an HTML element](#)<sup>p1321</sup> for the token.

↪ **A start tag whose tag name is "plaintext"**

If the [stack of open elements](#)<sup>p1286</sup> has a [p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Switch the tokenizer to the [PLAINTEXT state](#)<sup>p1292</sup>.

**Note**

Once a start tag with the tag name "plaintext" has been seen, all remaining tokens will be character tokens (and a final end-of-file token) because there is no way to switch the tokenizer out of the [PLAINTEXT state](#)<sup>p1292</sup>. However, as the tree builder remains in its existing insertion mode, it might [reconstruct the active formatting elements](#)<sup>p1289</sup> while processing those character tokens. This means that the parser can insert other elements into the [plaintext](#)<sup>p1426</sup> element.

↪ **A start tag whose tag name is "button"**

1. If the [stack of open elements](#)<sup>p1286</sup> has a [button element in scope](#)<sup>p1287</sup>, then run these substeps:
  1. [Parse error](#)<sup>p1273</sup>.
  2. [Generate implied end tags](#)<sup>p1324</sup>.
  3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [button](#)<sup>p566</sup> element has been popped from the stack.
2. [Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.
3. [Insert an HTML element](#)<sup>p1321</sup> for the token.
4. Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **An end tag whose tag name is one of: "address", "article", "aside", "blockquote", "button", "center", "details", "dialog", "dir", "div", "dl", "fieldset", "figcaption", "figure", "footer", "header", "hgroup", "listing", "main", "menu",**

"nav", "ol", "pre", "search", "section", "summary", "ul"

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in scope](#)<sup>p1287</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1324</sup>.
2. If the [current node](#)<sup>p1286</sup> is not an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until an [HTML element](#)<sup>p45</sup> with the same tag name as the token has been popped from the stack.

#### ↪ An end tag whose tag name is "form"

If there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then run these substeps:

1. Let *node* be the element that the [form element pointer](#)<sup>p1289</sup> is set to, or null if it is not set to an element.
2. Set the [form element pointer](#)<sup>p1289</sup> to null.
3. If *node* is null or if the [stack of open elements](#)<sup>p1286</sup> does not [have node in scope](#)<sup>p1287</sup>, then this is a [parse error](#)<sup>p1273</sup>; return and ignore the token.
4. [Generate implied end tags](#)<sup>p1324</sup>.
5. If the [current node](#)<sup>p1286</sup> is not *node*, then this is a [parse error](#)<sup>p1273</sup>.
6. Remove *node* from the [stack of open elements](#)<sup>p1286</sup>.

If there is a [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then run these substeps instead:

1. If the [stack of open elements](#)<sup>p1286</sup> does not [have a form element in scope](#)<sup>p1287</sup>, then this is a [parse error](#)<sup>p1273</sup>; return and ignore the token.
2. [Generate implied end tags](#)<sup>p1324</sup>.
3. If the [current node](#)<sup>p1286</sup> is not a [form](#)<sup>p514</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
4. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [form](#)<sup>p514</sup> element has been popped from the stack.

#### ↪ An end tag whose tag name is "p"

If the [stack of open elements](#)<sup>p1286</sup> does not [have a p element in button scope](#)<sup>p1288</sup>, then this is a [parse error](#)<sup>p1273</sup>; [insert an HTML element](#)<sup>p1321</sup> for a "p" start tag token with no attributes.

[Close a p element](#)<sup>p1340</sup>.

#### ↪ An end tag whose tag name is "li"

If the [stack of open elements](#)<sup>p1286</sup> does not [have an li element in list item scope](#)<sup>p1288</sup>, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1324</sup>, except for [li](#)<sup>p241</sup> elements.
2. If the [current node](#)<sup>p1286</sup> is not an [li](#)<sup>p241</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until an [li](#)<sup>p241</sup> element has been popped from the stack.

#### ↪ An end tag whose tag name is one of: "dd", "dt"

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in scope](#)<sup>p1287</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1324</sup>, except for [HTML elements](#)<sup>p45</sup> with the same tag name as the token.
2. If the [current node](#)<sup>p1286</sup> is not an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse](#)

[error<sup>p1273</sup>](#).

3. Pop elements from the [stack of open elements<sup>p1286</sup>](#) until an [HTML element<sup>p45</sup>](#) with the same tag name as the token has been popped from the stack.

↪ **An end tag whose tag name is one of: "h1", "h2", "h3", "h4", "h5", "h6"**

If the [stack of open elements<sup>p1286</sup>](#) does not [have an element in scope<sup>p1287</sup>](#) that is an [HTML element<sup>p45</sup>](#) and whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6", then this is a [parse error<sup>p1273</sup>](#); ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags<sup>p1324</sup>](#).
2. If the [current node<sup>p1286</sup>](#) is not an [HTML element<sup>p45</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p1273</sup>](#).
3. Pop elements from the [stack of open elements<sup>p1286</sup>](#) until an [HTML element<sup>p45</sup>](#) whose tag name is one of "h1", "h2", "h3", "h4", "h5", or "h6" has been popped from the stack.

↪ **An end tag whose tag name is "sarcasm"**

Take a deep breath, then act as described in the "any other end tag" entry below.

↪ **A start tag whose tag name is "a"**

If the [list of active formatting elements<sup>p1288</sup>](#) contains an [a<sup>p257</sup>](#) element between the end of the list and the last [marker<sup>p1288</sup>](#) on the list (or the start of the list if there is no [marker<sup>p1288</sup>](#) on the list), then this is a [parse error<sup>p1273</sup>](#); run the [adoption agency algorithm<sup>p1340</sup>](#) for the token, then remove that element from the [list of active formatting elements<sup>p1288</sup>](#) and the [stack of open elements<sup>p1286</sup>](#) if the [adoption agency algorithm<sup>p1340</sup>](#) didn't already remove it (it might not have if the element is not [in table scope<sup>p1288</sup>](#)).

**Example**

In the non-conforming stream `<a href="a">a<table><a href="b">b</table>x`, the first [a<sup>p257</sup>](#) element would be closed upon seeing the second one, and the "x" character would be inside a link to "b", not to "a". This is despite the fact that the outer [a<sup>p257</sup>](#) element is not in table scope (meaning that a regular `</a>` end tag at the start of the table wouldn't close the outer [a<sup>p257</sup>](#) element). The result is that the two [a<sup>p257</sup>](#) elements are indirectly nested inside each other — non-conforming markup will often result in non-conforming DOMs when parsed.

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1288</sup>](#) that element.

↪ **A start tag whose tag name is one of: "b", "big", "code", "em", "font", "i", "s", "small", "strike", "strong", "tt", "u"**

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1288</sup>](#) that element.

↪ **A start tag whose tag name is "nobr"**

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

If the [stack of open elements<sup>p1286</sup>](#) has a [nobr](#) element in scope<sup>p1287</sup>, then this is a [parse error<sup>p1273</sup>](#); run the [adoption agency algorithm<sup>p1340</sup>](#) for the token, then once again [reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token. [Push onto the list of active formatting elements<sup>p1288</sup>](#) that element.

↪ **An end tag whose tag name is one of: "a", "b", "big", "code", "em", "font", "i", "nobr", "s", "small", "strike", "strong", "tt", "u"**

Run the [adoption agency algorithm<sup>p1340</sup>](#) for the token.

↪ **A start tag whose tag name is one of: "applet", "marquee", "object"**

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token.

Insert a [marker<sup>p1288</sup>](#) at the end of the [list of active formatting elements<sup>p1288</sup>](#).

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **An end tag token whose tag name is one of: "applet", "marquee", "object"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in scope](#)<sup>p1287</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, run these steps:

1. [Generate implied end tags](#)<sup>p1324</sup>.
2. If the [current node](#)<sup>p1286</sup> is not an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until an [HTML element](#)<sup>p45</sup> with the same tag name as the token has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker](#)<sup>p1289</sup>.

↪ **A start tag whose tag name is "table"**

If the [Document](#)<sup>p130</sup> is *not* set to [quirks mode](#), and the [stack of open elements](#)<sup>p1286</sup> [has a p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

Switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>".

↪ **An end tag whose tag name is "br"**

[Parse error](#)<sup>p1273</sup>. Drop the attributes from the token, and act as described in the next entry; i.e. act as if this was a "br" start tag token with no attributes, rather than the end tag token that it actually is.

↪ **A start tag whose tag name is one of: "area", "br", "embed", "img", "keygen", "wbr"**

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **A start tag whose tag name is "input"**

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#) match for the string "hidden", then: set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **A start tag whose tag name is one of: "param", "source", "track"**

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

↪ **A start tag whose tag name is "hr"**

If the [stack of open elements](#)<sup>p1286</sup> [has a p element in button scope](#)<sup>p1288</sup>, then [close a p element](#)<sup>p1340</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".

↪ **A start tag whose tag name is "image"**

[Parse error<sup>p1273</sup>](#). Change the token's tag name to "img" and reprocess it. (Don't ask.)

↪ **A start tag whose tag name is "textarea"**

Run these steps:

1. [Insert an HTML element<sup>p1321</sup>](#) for the token.
2. If the [next token<sup>p1318</sup>](#) is a U+000A LINE FEED (LF) character token, then ignore that token and move on to the next one. (Newlines at the start of [textarea<sup>p579</sup>](#) elements are ignored as an authoring convenience.)
3. Switch the tokenizer to the [RCDATA state<sup>p1291</sup>](#).
4. Let the [original insertion mode<sup>p1285</sup>](#) be the current [insertion mode<sup>p1285</sup>](#).
5. Set the [frameset-ok flag<sup>p1290</sup>](#) to "not ok".
6. Switch the [insertion mode<sup>p1285</sup>](#) to "[text<sup>p1342</sup>](#)".

↪ **A start tag whose tag name is "xmp"**

If the [stack of open elements<sup>p1286</sup>](#) has a [p element in button scope<sup>p1288</sup>](#), then [close a p element<sup>p1340</sup>](#).

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

Set the [frameset-ok flag<sup>p1290</sup>](#) to "not ok".

Follow the [generic raw text element parsing algorithm<sup>p1324</sup>](#).

↪ **A start tag whose tag name is "iframe"**

Set the [frameset-ok flag<sup>p1290</sup>](#) to "not ok".

Follow the [generic raw text element parsing algorithm<sup>p1324</sup>](#).

↪ **A start tag whose tag name is "noembed"**

↪ **A start tag whose tag name is "noscript", if the [scripting flag<sup>p1289</sup>](#) is enabled**

Follow the [generic raw text element parsing algorithm<sup>p1324</sup>](#).

↪ **A start tag whose tag name is "select"**

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token.

Set the [frameset-ok flag<sup>p1290</sup>](#) to "not ok".

If the [insertion mode<sup>p1285</sup>](#) is one of "[in table<sup>p1343</sup>](#)", "[in caption<sup>p1346</sup>](#)", "[in table body<sup>p1347</sup>](#)", "[in row<sup>p1348</sup>](#)", or "[in cell<sup>p1349</sup>](#)", then switch the [insertion mode<sup>p1285</sup>](#) to "[in select in table<sup>p1352</sup>](#)". Otherwise, switch the [insertion mode<sup>p1285</sup>](#) to "[in select<sup>p1350</sup>](#)".

↪ **A start tag whose tag name is one of: "optgroup", "option"**

If the [current node<sup>p1286</sup>](#) is an [option<sup>p577</sup>](#) element, then pop the [current node<sup>p1286</sup>](#) off the [stack of open elements<sup>p1286</sup>](#).

[Reconstruct the active formatting elements<sup>p1289</sup>](#), if any.

[Insert an HTML element<sup>p1321</sup>](#) for the token.

↪ **A start tag whose tag name is one of: "rb", "rtc"**

If the [stack of open elements<sup>p1286</sup>](#) has a [ruby element in scope<sup>p1287</sup>](#), then [generate implied end tags<sup>p1324</sup>](#). If the [current node<sup>p1286</sup>](#) is not now a [ruby<sup>p270</sup>](#) element, this is a [parse error<sup>p1273</sup>](#).

[Insert an HTML element<sup>p1321</sup>](#) for the token.

↪ **A start tag whose tag name is one of: "rp", "rt"**

If the [stack of open elements<sup>p1286</sup>](#) has a [ruby element in scope<sup>p1287</sup>](#), then [generate implied end tags<sup>p1324</sup>](#), except for [rtc<sup>p1427</sup>](#) elements. If the [current node<sup>p1286</sup>](#) is not now a [rtc<sup>p1427</sup>](#) element or a [ruby<sup>p270</sup>](#) element, this is a [parse error<sup>p1273</sup>](#).

[Insert an HTML element<sup>p1321</sup>](#) for the token.

↪ **A start tag whose tag name is "math"**

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Adjust MathML attributes](#)<sup>p1322</sup> for the token. (This fixes the case of MathML attributes that are not all lowercase.)

[Adjust foreign attributes](#)<sup>p1323</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink.)

[Insert a foreign element](#)<sup>p1321</sup> for the token, with [MathML namespace](#) and false.

If the token has its [self-closing flag](#)<sup>p1290</sup> set, pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup> and [acknowledge the token's self-closing flag](#)<sup>p1290</sup>.

↪ **A start tag whose tag name is "svg"**

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Adjust SVG attributes](#)<sup>p1322</sup> for the token. (This fixes the case of SVG attributes that are not all lowercase.)

[Adjust foreign attributes](#)<sup>p1323</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)

[Insert a foreign element](#)<sup>p1321</sup> for the token, with [SVG namespace](#) and false.

If the token has its [self-closing flag](#)<sup>p1290</sup> set, pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup> and [acknowledge the token's self-closing flag](#)<sup>p1290</sup>.

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "frame", "head", "tbody", "td", "tfoot", "th", "thead", "tr"**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Any other start tag**

[Reconstruct the active formatting elements](#)<sup>p1289</sup>, if any.

[Insert an HTML element](#)<sup>p1321</sup> for the token.

**Note**

*This element will be an [ordinary](#)<sup>p1287</sup> element. With one exception: if the [scripting flag](#)<sup>p1289</sup> is disabled, it can also be a [noscript](#)<sup>p669</sup> element.*

↪ **Any other end tag**

Run these steps:

1. Initialize *node* to be the [current node](#)<sup>p1286</sup> (the bottommost node of the stack).
2. *Loop*: If *node* is an [HTML element](#)<sup>p45</sup> with the same tag name as the token, then:
  1. [Generate implied end tags](#)<sup>p1324</sup>, except for [HTML elements](#)<sup>p45</sup> with the same tag name as the token.
  2. If *node* is not the [current node](#)<sup>p1286</sup>, then this is a [parse error](#)<sup>p1273</sup>.
  3. Pop all the nodes from the [current node](#)<sup>p1286</sup> up to *node*, including *node*, then stop these steps.
3. Otherwise, if *node* is in the [special](#)<sup>p1287</sup> category, then this is a [parse error](#)<sup>p1273</sup>; ignore the token, and return.
4. Set *node* to the previous entry in the [stack of open elements](#)<sup>p1286</sup>.
5. Return to the step labeled *loop*.

When the steps above say the user agent is to **close a p element**, it means that the user agent must run the following steps:

1. [Generate implied end tags](#)<sup>p1324</sup>, except for [p](#)<sup>p229</sup> elements.
2. If the [current node](#)<sup>p1286</sup> is not a [p](#)<sup>p229</sup> element, then this is a [parse error](#)<sup>p1273</sup>.
3. Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [p](#)<sup>p229</sup> element has been popped from the stack.

The **adoption agency algorithm**, which takes as its only argument a token *token* for which the algorithm is being run, consists of the following steps:

1. Let *subject* be *token*'s tag name.
2. If the [current node](#)<sup>p1286</sup> is an [HTML element](#)<sup>p45</sup> whose tag name is *subject*, and the [current node](#)<sup>p1286</sup> is not in the [list of active formatting elements](#)<sup>p1288</sup>, then pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup> and return.
3. Let *outerLoopCounter* be 0.
4. While true:
  1. If *outerLoopCounter* is greater than or equal to 8, then return.
  2. Increment *outerLoopCounter* by 1.
  3. Let *formattingElement* be the last element in the [list of active formatting elements](#)<sup>p1288</sup> that:
    - is between the end of the list and the last [marker](#)<sup>p1288</sup> in the list, if any, or the start of the list otherwise, and
    - has the tag name *subject*.

If there is no such element, then return and instead act as described in the "any other end tag" entry above.
  4. If *formattingElement* is not in the [stack of open elements](#)<sup>p1286</sup>, then this is a [parse error](#)<sup>p1273</sup>; remove the element from the list, and return.
  5. If *formattingElement* is in the [stack of open elements](#)<sup>p1286</sup>, but the element is not [in scope](#)<sup>p1287</sup>, then this is a [parse error](#)<sup>p1273</sup>; return.
  6. If *formattingElement* is not the [current node](#)<sup>p1286</sup>, this is a [parse error](#)<sup>p1273</sup>. (But do not return.)
  7. Let *furthestBlock* be the topmost node in the [stack of open elements](#)<sup>p1286</sup> that is lower in the stack than *formattingElement*, and is an element in the [special](#)<sup>p1287</sup> category. There might not be one.
  8. If there is no *furthestBlock*, then the UA must first pop all the nodes from the bottom of the [stack of open elements](#)<sup>p1286</sup>, from the [current node](#)<sup>p1286</sup> up to and including *formattingElement*, then remove *formattingElement* from the [list of active formatting elements](#)<sup>p1288</sup>, and finally return.
  9. Let *commonAncestor* be the element immediately above *formattingElement* in the [stack of open elements](#)<sup>p1286</sup>.
  10. Let a bookmark note the position of *formattingElement* in the [list of active formatting elements](#)<sup>p1288</sup> relative to the elements on either side of it in the list.
  11. Let *node* and *lastNode* be *furthestBlock*.
  12. Let *innerLoopCounter* be 0.
  13. While true:
    1. Increment *innerLoopCounter* by 1.
    2. Let *node* be the element immediately above *node* in the [stack of open elements](#)<sup>p1286</sup>, or if *node* is no longer in the [stack of open elements](#)<sup>p1286</sup> (e.g. because it got removed by this algorithm), the element that was immediately above *node* in the [stack of open elements](#)<sup>p1286</sup> before *node* was removed.
    3. If *node* is *formattingElement*, then [break](#).
    4. If *innerLoopCounter* is greater than 3 and *node* is in the [list of active formatting elements](#)<sup>p1288</sup>, then remove *node* from the [list of active formatting elements](#)<sup>p1288</sup>.
    5. If *node* is not in the [list of active formatting elements](#)<sup>p1288</sup>, then remove *node* from the [stack of open elements](#)<sup>p1286</sup> and [continue](#).
    6. [Create an element for the token](#)<sup>p1320</sup> for which the element *node* was created, in the [HTML namespace](#), with *commonAncestor* as the intended parent; replace the entry for *node* in the [list of active formatting elements](#)<sup>p1288</sup> with an entry for the new element, replace the entry for *node* in the [stack of open elements](#)<sup>p1286</sup> with an entry for the new element, and let *node* be the new element.
    7. If *lastNode* is *furthestBlock*, then move the aforementioned bookmark to be immediately after the new *node* in the [list of active formatting elements](#)<sup>p1288</sup>.
    8. [Append](#) *lastNode* to *node*.

9. Set *lastNode* to *node*.

14. Insert whatever *lastNode* ended up being in the previous step at the [appropriate place for inserting a node](#)<sup>p1319</sup>, but using *commonAncestor* as the *override target*.
15. [Create an element for the token](#)<sup>p1320</sup> for which *formattingElement* was created, in the [HTML namespace](#), with *furthestBlock* as the intended parent.
16. Take all of the child nodes of *furthestBlock* and append them to the element created in the last step.
17. Append that new element to *furthestBlock*.
18. Remove *formattingElement* from the [list of active formatting elements](#)<sup>p1288</sup>, and insert the new element into the [list of active formatting elements](#)<sup>p1288</sup> at the position of the aforementioned bookmark.
19. Remove *formattingElement* from the [stack of open elements](#)<sup>p1286</sup>, and insert the new element into the [stack of open elements](#)<sup>p1286</sup> immediately below the position of *furthestBlock* in that stack.

#### Note

*This algorithm's name, the "adoption agency algorithm", comes from the way it causes elements to change parents, and is in contrast with [other possible algorithms](#) for dealing with misnested content.*

#### 13.2.6.4.8 The "text" insertion mode §<sup>p13</sup> 42

When the user agent is to apply the rules for the "[text](#)<sup>p1342</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

##### ↪ A character token

[Insert the token's character](#)<sup>p1323</sup>.

#### Note

*This can never be a U+0000 NULL character; the tokenizer converts those to U+FFFD REPLACEMENT CHARACTER characters.*

##### ↪ An end-of-file token

[Parse error](#)<sup>p1273</sup>.

If the [current node](#)<sup>p1286</sup> is a [script](#)<sup>p652</sup> element, then set its [already started](#)<sup>p659</sup> to true.

Pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to the [original insertion mode](#)<sup>p1285</sup> and reprocess the token.

##### ↪ An end tag whose tag name is "script"

If the [active speculative HTML parser](#)<sup>p1360</sup> is null and the [JavaScript execution context stack](#) is empty, then [perform a microtask checkpoint](#)<sup>p1131</sup>.

Let *script* be the [current node](#)<sup>p1286</sup> (which will be a [script](#)<sup>p652</sup> element).

Pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to the [original insertion mode](#)<sup>p1285</sup>.

Let the *old insertion point* have the same value as the current [insertion point](#)<sup>p1285</sup>. Let the [insertion point](#)<sup>p1285</sup> be just before the [next input character](#)<sup>p1285</sup>.

Increment the parser's [script nesting level](#)<sup>p1273</sup> by one.

If the [active speculative HTML parser](#)<sup>p1360</sup> is null, then [prepare the script element](#)<sup>p661</sup> *script*. This might cause some script to execute, which might cause [new characters to be inserted into the tokenizer](#)<sup>p1153</sup>, and might cause the tokenizer to output more tokens, resulting in a [reentrant invocation of the parser](#)<sup>p1272</sup>.

Decrement the parser's [script nesting level](#)<sup>p1273</sup> by one. If the parser's [script nesting level](#)<sup>p1273</sup> is zero, then set the [parser pause](#)

[flag<sup>p1273</sup>](#) to false.

Let the [insertion point<sup>p1285</sup>](#) have the value of the *old insertion point*. (In other words, restore the [insertion point<sup>p1285</sup>](#) to its previous value. This value might be the "undefined" value.)

At this stage, if the [pending parsing-blocking script<sup>p665</sup>](#) is not null, then:

↪ **If the [script nesting level<sup>p1273</sup>](#) is not zero:**

Set the [parser pause flag<sup>p1273</sup>](#) to true, and abort the processing of any nested invocations of the tokenizer, yielding control back to the caller. (Tokenization will resume when the caller returns to the "outer" tree construction stage.)

**Note**

*The tree construction stage of this particular parser is [being called reentrantly<sup>p1272</sup>](#), say from a call to [document.write\(\)<sup>p1153</sup>](#).*

↪ **Otherwise:**

While the [pending parsing-blocking script<sup>p665</sup>](#) is not null:

1. Let *the script* be the [pending parsing-blocking script<sup>p665</sup>](#).
2. Set the [pending parsing-blocking script<sup>p665</sup>](#) to null.
3. [Start the speculative HTML parser<sup>p1360</sup>](#) for this instance of the HTML parser.
4. Block the [tokenizer<sup>p1290</sup>](#) for this instance of the [HTML parser<sup>p1271</sup>](#), such that the [event loop<sup>p1123</sup>](#) will not run [tasks<sup>p1124</sup>](#) that invoke the [tokenizer<sup>p1290</sup>](#).
5. If the parser's [Document<sup>p130</sup>](#) [has a style sheet that is blocking scripts<sup>p204</sup>](#) or the script's [ready to be parser-executed<sup>p659</sup>](#) is false: [spin the event loop<sup>p1131</sup>](#) until the parser's [Document<sup>p130</sup>](#) [has no style sheet that is blocking scripts<sup>p204</sup>](#) and the script's [ready to be parser-executed<sup>p659</sup>](#) becomes true.
6. If this [parser has been aborted<sup>p1359</sup>](#) in the meantime, return.

**Note**

*This could happen if, e.g., while the [spin the event loop<sup>p1131</sup>](#) algorithm is running, the [Document<sup>p130</sup>](#) gets [destroyed<sup>p1066</sup>](#), or the [document.open\(\)<sup>p1151</sup>](#) method gets invoked on the [Document<sup>p130</sup>](#).*

7. [Stop the speculative HTML parser<sup>p1361</sup>](#) for this instance of the HTML parser.
8. Unblock the [tokenizer<sup>p1290</sup>](#) for this instance of the [HTML parser<sup>p1271</sup>](#), such that [tasks<sup>p1124</sup>](#) that invoke the [tokenizer<sup>p1290</sup>](#) can again be run.
9. Let the [insertion point<sup>p1285</sup>](#) be just before the [next input character<sup>p1285</sup>](#).
10. Increment the parser's [script nesting level<sup>p1273</sup>](#) by one (it should be zero before this step, so this sets it to one).
11. [Execute the script element<sup>p665</sup>](#) *the script*.
12. Decrement the parser's [script nesting level<sup>p1273</sup>](#) by one. If the parser's [script nesting level<sup>p1273</sup>](#) is zero (which it always should be at this point), then set the [parser pause flag<sup>p1273</sup>](#) to false.
13. Let the [insertion point<sup>p1285</sup>](#) be undefined again.

↪ **Any other end tag**

Pop the [current node<sup>p1286</sup>](#) off the [stack of open elements<sup>p1286</sup>](#).

Switch the [insertion mode<sup>p1285</sup>](#) to the [original insertion mode<sup>p1285</sup>](#).

#### 13.2.6.4.9 The "in table" insertion mode <sup>§<sup>p13</sup> 43</sup>

When the user agent is to apply the rules for the ["in table<sup>p1343</sup>" insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A character token, if the [current node<sup>p1286</sup>](#) is [table<sup>p478</sup>](#), [tbody<sup>p489</sup>](#), [template<sup>p671</sup>](#), [tfoot<sup>p491</sup>](#), [thead<sup>p490</sup>](#), or [tr<sup>p492</sup>](#) element**

Let the **pending table character tokens** be an empty list of tokens.

Let the [original insertion mode](#)<sup>p1285</sup> be the current [insertion mode](#)<sup>p1285</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in table text](#)<sup>p1345</sup>" and reprocess the token.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "caption"**

[Clear the stack back to a table context](#)<sup>p1345</sup>. (See below.)

Insert a [marker](#)<sup>p1288</sup> at the end of the [list of active formatting elements](#)<sup>p1288</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token, then switch the [insertion mode](#)<sup>p1285</sup> to "[in caption](#)<sup>p1346</sup>".

↪ **A start tag whose tag name is "colgroup"**

[Clear the stack back to a table context](#)<sup>p1345</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for the token, then switch the [insertion mode](#)<sup>p1285</sup> to "[in column group](#)<sup>p1346</sup>".

↪ **A start tag whose tag name is "col"**

[Clear the stack back to a table context](#)<sup>p1345</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for a "colgroup" start tag token with no attributes, then switch the [insertion mode](#)<sup>p1285</sup> to "[in column group](#)<sup>p1346</sup>".

Reprocess the current token.

↪ **A start tag whose tag name is one of: "tbody", "tfoot", "thead"**

[Clear the stack back to a table context](#)<sup>p1345</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for the token, then switch the [insertion mode](#)<sup>p1285</sup> to "[in table body](#)<sup>p1347</sup>".

↪ **A start tag whose tag name is one of: "td", "th", "tr"**

[Clear the stack back to a table context](#)<sup>p1345</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for a "tbody" start tag token with no attributes, then switch the [insertion mode](#)<sup>p1285</sup> to "[in table body](#)<sup>p1347</sup>".

Reprocess the current token.

↪ **A start tag whose tag name is "table"**

[Parse error](#)<sup>p1273</sup>.

If the [stack of open elements](#)<sup>p1286</sup> does not [have a table element in table scope](#)<sup>p1288</sup>, ignore the token.

Otherwise:

Pop elements from this stack until a [table](#)<sup>p478</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

Reprocess the token.

↪ **An end tag whose tag name is "table"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have a table element in table scope](#)<sup>p1288</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

Pop elements from this stack until a [table](#)<sup>p478</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

↪ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"**

[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **A start tag whose tag name is one of: "style", "script", "template"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for<sup>p1285</sup>](#) the "in head<sup>p1328</sup>" [insertion mode<sup>p1285</sup>](#).

↪ **A start tag whose tag name is "input"**

If the token does not have an attribute with the name "type", or if it does, but that attribute's value is not an [ASCII case-insensitive](#) match for the string "hidden", then: act as described in the "anything else" entry below.

Otherwise:

[Parse error<sup>p1273</sup>](#).

[Insert an HTML element<sup>p1321</sup>](#) for the token.

Pop that [input<sup>p520</sup>](#) element off the [stack of open elements<sup>p1286</sup>](#).

[Acknowledge the token's self-closing flag<sup>p1290</sup>](#), if it is set.

↪ **A start tag whose tag name is "form"**

[Parse error<sup>p1273</sup>](#).

If there is a [template<sup>p671</sup>](#) element on the [stack of open elements<sup>p1286</sup>](#), or if the [form element pointer<sup>p1289</sup>](#) is not null, ignore the token.

Otherwise:

[Insert an HTML element<sup>p1321</sup>](#) for the token, and set the [form element pointer<sup>p1289</sup>](#) to point to the element created.

Pop that [form<sup>p514</sup>](#) element off the [stack of open elements<sup>p1286</sup>](#).

↪ **An end-of-file token**

Process the token [using the rules for<sup>p1285</sup>](#) the "in body<sup>p1332</sup>" [insertion mode<sup>p1285</sup>](#).

↪ **Anything else**

[Parse error<sup>p1273</sup>](#). Enable [foster parenting<sup>p1319</sup>](#), process the token [using the rules for<sup>p1285</sup>](#) the "in body<sup>p1332</sup>" [insertion mode<sup>p1285</sup>](#), and then disable [foster parenting<sup>p1319</sup>](#).

When the steps above require the UA to **clear the stack back to a table context**, it means that the UA must, while the [current node<sup>p1286</sup>](#) is not a [table<sup>p478</sup>](#), [template<sup>p671</sup>](#), or [html<sup>p172</sup>](#) element, pop elements from the [stack of open elements<sup>p1286</sup>](#).

#### Note

*This is the same list of elements as used in the [has an element in table scope<sup>p1288</sup>](#) steps.*

#### Note

*The [current node<sup>p1286</sup>](#) being an [html<sup>p172</sup>](#) element after this process is a [fragment case<sup>p1373</sup>](#).*

### 13.2.6.4.10 The "in table text" insertion mode §<sup>p13</sup> 45

When the user agent is to apply the rules for the "in table text<sup>p1345</sup>" [insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **Any other character token**

Append the character token to the [pending table character tokens<sup>p1343</sup>](#) list.

↪ **Anything else**

If any of the tokens in the [pending table character tokens<sup>p1343</sup>](#) list are character tokens that are not [ASCII whitespace](#), then this is a [parse error<sup>p1273</sup>](#): reprocess the character tokens in the [pending table character tokens<sup>p1343</sup>](#) list using the rules given in the "anything else" entry in the ["in table<sup>p1343</sup>"](#) insertion mode.

Otherwise, [insert the characters<sup>p1323</sup>](#) given by the [pending table character tokens<sup>p1343</sup>](#) list.

Switch the [insertion mode<sup>p1285</sup>](#) to the [original insertion mode<sup>p1285</sup>](#) and reprocess the token.

**13.2.6.4.11 The "in caption" insertion mode** §<sup>p13</sup>  
46

When the user agent is to apply the rules for the ["in caption<sup>p1346</sup>"](#) [insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **An end tag whose tag name is "caption"**

If the [stack of open elements<sup>p1286</sup>](#) does not [have a caption element in table scope<sup>p1288</sup>](#), this is a [parse error<sup>p1273</sup>](#); ignore the token. ([fragment case<sup>p1373</sup>](#))

Otherwise:

[Generate implied end tags<sup>p1324</sup>](#).

Now, if the [current node<sup>p1286</sup>](#) is not a [caption<sup>p486</sup>](#) element, then this is a [parse error<sup>p1273</sup>](#).

Pop elements from this stack until a [caption<sup>p486</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p1289</sup>](#).

Switch the [insertion mode<sup>p1285</sup>](#) to ["in table<sup>p1343</sup>"](#).

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"**

↪ **An end tag whose tag name is "table"**

If the [stack of open elements<sup>p1286</sup>](#) does not [have a caption element in table scope<sup>p1288</sup>](#), this is a [parse error<sup>p1273</sup>](#); ignore the token. ([fragment case<sup>p1373</sup>](#))

Otherwise:

[Generate implied end tags<sup>p1324</sup>](#).

Now, if the [current node<sup>p1286</sup>](#) is not a [caption<sup>p486</sup>](#) element, then this is a [parse error<sup>p1273</sup>](#).

Pop elements from this stack until a [caption<sup>p486</sup>](#) element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker<sup>p1289</sup>](#).

Switch the [insertion mode<sup>p1285</sup>](#) to ["in table<sup>p1343</sup>"](#).

Reprocess the token.

↪ **An end tag whose tag name is one of: "body", "col", "colgroup", "html", "tbody", "td", "tfoot", "th", "thead", "tr"**  
[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **Anything else**

Process the token [using the rules for<sup>p1285</sup>](#) the ["in body<sup>p1332</sup>"](#) [insertion mode<sup>p1285</sup>](#).

**13.2.6.4.12 The "in column group" insertion mode** §<sup>p13</sup>  
46

When the user agent is to apply the rules for the ["in column group<sup>p1346</sup>"](#) [insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED**

(FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE

[Insert the character](#)<sup>p1323</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is "col"**

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

↪ **An end tag whose tag name is "colgroup"**

If the [current node](#)<sup>p1286</sup> is not a [colgroup](#)<sup>p487</sup> element, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>".

↪ **An end tag whose tag name is "col"**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "template"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **An end-of-file token**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **Anything else**

If the [current node](#)<sup>p1286</sup> is not a [colgroup](#)<sup>p487</sup> element, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise, pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>".

Reprocess the token.

#### 13.2.6.4.13 The "[in table body](#)" [insertion mode](#) §<sup>p13</sup><sub>47</sub>

When the user agent is to apply the rules for the "[in table body](#)<sup>p1347</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A start tag whose tag name is "tr"**

[Clear the stack back to a table body context](#)<sup>p1348</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for the token, then switch the [insertion mode](#)<sup>p1285</sup> to "[in row](#)<sup>p1348</sup>".

↪ **A start tag whose tag name is one of: "th", "td"**

[Parse error](#)<sup>p1273</sup>.

[Clear the stack back to a table body context](#)<sup>p1348</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for a "tr" start tag token with no attributes, then switch the [insertion mode](#)<sup>p1285</sup> to "[in row](#)<sup>p1348</sup>".

Reprocess the current token.

↪ **An end tag whose tag name is one of: "tbody", "tfoot", "thead"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in table scope](#)<sup>p1288</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as the token, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1348</sup>. (See below.)

Pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>".

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead"**

↪ **An end tag whose tag name is "table"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have a tbody, tthead, or ttfoot element in table scope](#)<sup>p1288</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table body context](#)<sup>p1348</sup>. (See below.)

Pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in table](#)<sup>p1343</sup>".

Reprocess the token.

↪ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th", "tr"**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Anything else**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in table](#)<sup>p1343</sup>" [insertion mode](#)<sup>p1285</sup>.

When the steps above require the UA to **clear the stack back to a table body context**, it means that the UA must, while the [current node](#)<sup>p1286</sup> is not a [tbody](#)<sup>p489</sup>, [tfoot](#)<sup>p491</sup>, [thead](#)<sup>p490</sup>, [template](#)<sup>p671</sup>, or [html](#)<sup>p172</sup> element, pop elements from the [stack of open elements](#)<sup>p1286</sup>.

**Note**

The [current node](#)<sup>p1286</sup> being an [html](#)<sup>p172</sup> element after this process is a [fragment case](#)<sup>p1373</sup>.

**13.2.6.4.14 The "in row" insertion mode** §<sup>p13</sup><sub>48</sub>

When the user agent is to apply the rules for the "[in row](#)<sup>p1348</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A start tag whose tag name is one of: "th", "td"**

[Clear the stack back to a table row context](#)<sup>p1349</sup>. (See below.)

[Insert an HTML element](#)<sup>p1321</sup> for the token, then switch the [insertion mode](#)<sup>p1285</sup> to "[in cell](#)<sup>p1349</sup>".

Insert a [marker](#)<sup>p1288</sup> at the end of the [list of active formatting elements](#)<sup>p1288</sup>.

↪ **An end tag whose tag name is "tr"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have a tr element in table scope](#)<sup>p1288</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1349</sup>. (See below.)

Pop the [current node](#)<sup>p1286</sup> (which will be a [tr](#)<sup>p492</sup> element) from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in table body](#)<sup>p1347</sup>".

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "tfoot", "thead", "tr"**

↪ **An end tag whose tag name is "table"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have a tr element in table scope](#)<sup>p1288</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1349</sup>. (See below.)

Pop the [current node](#)<sup>p1286</sup> (which will be a [tr](#)<sup>p492</sup> element) from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to ["in table body"](#)<sup>p1347</sup>.

Reprocess the token.

↪ **An end tag whose tag name is one of: "tbody", "tfoot", "thead"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in table scope](#)<sup>p1288</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as the token, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

If the [stack of open elements](#)<sup>p1286</sup> does not [have a tr element in table scope](#)<sup>p1288</sup>, ignore the token.

Otherwise:

[Clear the stack back to a table row context](#)<sup>p1349</sup>. (See below.)

Pop the [current node](#)<sup>p1286</sup> (which will be a [tr](#)<sup>p492</sup> element) from the [stack of open elements](#)<sup>p1286</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to ["in table body"](#)<sup>p1347</sup>.

Reprocess the token.

↪ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html", "td", "th"**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **Anything else**

Process the token [using the rules for](#)<sup>p1285</sup> the ["in table"](#)<sup>p1343</sup> [insertion mode](#)<sup>p1285</sup>.

When the steps above require the UA to **clear the stack back to a table row context**, it means that the UA must, while the [current node](#)<sup>p1286</sup> is not a [tr](#)<sup>p492</sup>, [template](#)<sup>p671</sup>, or [html](#)<sup>p172</sup> element, pop elements from the [stack of open elements](#)<sup>p1286</sup>.

**Note**

*The [current node](#)<sup>p1286</sup> being an [html](#)<sup>p172</sup> element after this process is a [fragment case](#)<sup>p1373</sup>.*

**13.2.6.4.15 The "in cell" insertion mode** <sup>§<sup>p13</sup>  
49</sup>

When the user agent is to apply the rules for the ["in cell"](#)<sup>p1349</sup> [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **An end tag whose tag name is one of: "td", "th"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have an element in table scope](#)<sup>p1288</sup> that is an [HTML element](#)<sup>p45</sup> with the same tag name as that of the token, then this is a [parse error](#)<sup>p1273</sup>; ignore the token.

Otherwise:

[Generate implied end tags](#)<sup>p1324</sup>.

Now, if the [current node](#)<sup>p1286</sup> is not an [HTML element](#)<sup>p45</sup> with the same tag name as the token, then this is a [parse error](#)<sup>p1273</sup>.

Pop elements from the [stack of open elements](#)<sup>p1286</sup> until an [HTML element](#)<sup>p45</sup> with the same tag name as the token has been popped from the stack.

[Clear the list of active formatting elements up to the last marker](#)<sup>p1289</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to ["in row"](#)<sup>p1348</sup>.

↪ **A start tag whose tag name is one of: "caption", "col", "colgroup", "tbody", "td", "tfoot", "th", "thead", "tr"**

[Assert](#): The [stack of open elements](#)<sup>p1286</sup> [has a td or th element in table scope](#)<sup>p1288</sup>.

[Close the cell](#)<sup>p1350</sup> (see below) and reprocess the token.

↪ **An end tag whose tag name is one of: "body", "caption", "col", "colgroup", "html"**

[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **An end tag whose tag name is one of: "table", "tbody", "tfoot", "thead", "tr"**

If the [stack of open elements<sup>p1286</sup>](#) does not [have an element in table scope<sup>p1288</sup>](#) that is an [HTML element<sup>p45</sup>](#) with the same tag name as that of the token, then this is a [parse error<sup>p1273</sup>](#); ignore the token.

Otherwise, [close the cell<sup>p1350</sup>](#) (see below) and reprocess the token.

↪ **Anything else**

Process the token [using the rules for<sup>p1285</sup>](#) the ["in body<sup>p1332</sup>" insertion mode<sup>p1285</sup>](#).

Where the steps above say to **close the cell**, they mean to run the following algorithm:

1. [Generate implied end tags<sup>p1324</sup>](#).
2. If the [current node<sup>p1286</sup>](#) is not now a [td<sup>p493</sup>](#) element or a [th<sup>p495</sup>](#) element, then this is a [parse error<sup>p1273</sup>](#).
3. Pop elements from the [stack of open elements<sup>p1286</sup>](#) until a [td<sup>p493</sup>](#) element or a [th<sup>p495</sup>](#) element has been popped from the stack.
4. [Clear the list of active formatting elements up to the last marker<sup>p1289</sup>](#).
5. Switch the [insertion mode<sup>p1285</sup>](#) to ["in row<sup>p1348</sup>"](#).

#### Note

*The [stack of open elements<sup>p1286</sup>](#) cannot have both a [td<sup>p493</sup>](#) and a [th<sup>p495</sup>](#) element [in table scope<sup>p1288</sup>](#) at the same time, nor can it have neither when the [close the cell<sup>p1350</sup>](#) algorithm is invoked.*

#### 13.2.6.4.16 The "in select" insertion mode <sup>§<sup>p13</sup><sub>50</sub></sup>

When the user agent is to apply the rules for the ["in select<sup>p1350</sup>" insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A character token that is U+0000 NULL**

[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **Any other character token**

[Insert the token's character<sup>p1323</sup>](#).

↪ **A comment token**

[Insert a comment<sup>p1324</sup>](#).

↪ **A DOCTYPE token**

[Parse error<sup>p1273</sup>](#). Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for<sup>p1285</sup>](#) the ["in body<sup>p1332</sup>" insertion mode<sup>p1285</sup>](#).

↪ **A start tag whose tag name is "option"**

If the [current node<sup>p1286</sup>](#) is an [option<sup>p577</sup>](#) element, pop that node from the [stack of open elements<sup>p1286</sup>](#).

[Insert an HTML element<sup>p1321</sup>](#) for the token.

↪ **A start tag whose tag name is "optgroup"**

If the [current node<sup>p1286</sup>](#) is an [option<sup>p577</sup>](#) element, pop that node from the [stack of open elements<sup>p1286</sup>](#).

If the [current node<sup>p1286</sup>](#) is an [optgroup<sup>p576</sup>](#) element, pop that node from the [stack of open elements<sup>p1286</sup>](#).

[Insert an HTML element<sup>p1321</sup>](#) for the token.

↪ **A start tag whose tag name is "hr"**

If the [current node](#)<sup>p1286</sup> is an [option](#)<sup>p577</sup> element, pop that node from the [stack of open elements](#)<sup>p1286</sup>.

If the [current node](#)<sup>p1286</sup> is an [optgroup](#)<sup>p576</sup> element, pop that node from the [stack of open elements](#)<sup>p1286</sup>.

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

↪ **An end tag whose tag name is "optgroup"**

First, if the [current node](#)<sup>p1286</sup> is an [option](#)<sup>p577</sup> element, and the node immediately before it in the [stack of open elements](#)<sup>p1286</sup> is an [optgroup](#)<sup>p576</sup> element, then pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>.

If the [current node](#)<sup>p1286</sup> is an [optgroup](#)<sup>p576</sup> element, then pop that node from the [stack of open elements](#)<sup>p1286</sup>. Otherwise, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

↪ **An end tag whose tag name is "option"**

If the [current node](#)<sup>p1286</sup> is an [option](#)<sup>p577</sup> element, then pop that node from the [stack of open elements](#)<sup>p1286</sup>. Otherwise, this is a [parse error](#)<sup>p1273</sup>; ignore the token.

↪ **An end tag whose tag name is "select"**

If the [stack of open elements](#)<sup>p1286</sup> does not [have a select element in select scope](#)<sup>p1288</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token. ([fragment case](#)<sup>p1373</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [select](#)<sup>p568</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is "select"**

[Parse error](#)<sup>p1273</sup>.

If the [stack of open elements](#)<sup>p1286</sup> does not [have a select element in select scope](#)<sup>p1288</sup>, ignore the token. ([fragment case](#)<sup>p1373</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [select](#)<sup>p568</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

**Note**

*It just gets treated like an end tag.*

↪ **A start tag whose tag name is one of: "input", "keygen", "textarea"**

[Parse error](#)<sup>p1273</sup>.

If the [stack of open elements](#)<sup>p1286</sup> does not [have a select element in select scope](#)<sup>p1288</sup>, ignore the token. ([fragment case](#)<sup>p1373</sup>)

Otherwise:

Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [select](#)<sup>p568</sup> element has been popped from the stack.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

Reprocess the token.

↪ **A start tag whose tag name is one of: "script", "template"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for](#)<sup>p1285</sup> the ["in head"](#)<sup>p1328</sup> [insertion mode](#)<sup>p1285</sup>.

↪ **An end-of-file token**

Process the token [using the rules for](#)<sup>p1285</sup> the ["in body"](#)<sup>p1332</sup> [insertion mode](#)<sup>p1285</sup>.

↪ **Anything else**

[Parse error<sup>p1273</sup>](#). Ignore the token.

**13.2.6.4.17 The "in select in table" insertion mode** <sup>§<sup>p13</sup><sub>52</sub></sup>

When the user agent is to apply the rules for the "[in select in table<sup>p1352</sup>](#)" [insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A start tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"**

[Parse error<sup>p1273</sup>](#).

Pop elements from the [stack of open elements<sup>p1286</sup>](#) until a [select<sup>p568</sup>](#) element has been popped from the stack.

[Reset the insertion mode appropriately<sup>p1285</sup>](#).

Reprocess the token.

↪ **An end tag whose tag name is one of: "caption", "table", "tbody", "tfoot", "thead", "tr", "td", "th"**

[Parse error<sup>p1273</sup>](#).

If the [stack of open elements<sup>p1286</sup>](#) does not [have an element in table scope<sup>p1288</sup>](#) that is an [HTML element<sup>p45</sup>](#) with the same tag name as that of the token, then ignore the token.

Otherwise:

Pop elements from the [stack of open elements<sup>p1286</sup>](#) until a [select<sup>p568</sup>](#) element has been popped from the stack.

[Reset the insertion mode appropriately<sup>p1285</sup>](#).

Reprocess the token.

↪ **Anything else**

Process the token [using the rules for<sup>p1285</sup>](#) the "[in select<sup>p1350</sup>](#)" [insertion mode<sup>p1285</sup>](#).

**13.2.6.4.18 The "in template" insertion mode** <sup>§<sup>p13</sup><sub>52</sub></sup>

When the user agent is to apply the rules for the "[in template<sup>p1352</sup>](#)" [insertion mode<sup>p1285</sup>](#), the user agent must handle the token as follows:

↪ **A character token**

↪ **A comment token**

↪ **A DOCTYPE token**

Process the token [using the rules for<sup>p1285</sup>](#) the "[in body<sup>p1332</sup>](#)" [insertion mode<sup>p1285</sup>](#).

↪ **A start tag whose tag name is one of: "base", "basefont", "bgsound", "link", "meta", "noframes", "script", "style", "template", "title"**

↪ **An end tag whose tag name is "template"**

Process the token [using the rules for<sup>p1285</sup>](#) the "[in head<sup>p1328</sup>](#)" [insertion mode<sup>p1285</sup>](#).

↪ **A start tag whose tag name is one of: "caption", "colgroup", "tbody", "tfoot", "thead"**

Pop the [current template insertion mode<sup>p1285</sup>](#) off the [stack of template insertion modes<sup>p1285</sup>](#).

Push "[in table<sup>p1343</sup>](#)" onto the [stack of template insertion modes<sup>p1285</sup>](#) so that it is the new [current template insertion mode<sup>p1285</sup>](#).

Switch the [insertion mode<sup>p1285</sup>](#) to "[in table<sup>p1343</sup>](#)", and reprocess the token.

↪ **A start tag whose tag name is "col"**

Pop the [current template insertion mode<sup>p1285</sup>](#) off the [stack of template insertion modes<sup>p1285</sup>](#).

Push "[in\\_column\\_group](#)<sup>p1346</sup>" onto the [stack of template insertion modes](#)<sup>p1285</sup> so that it is the new [current template insertion mode](#)<sup>p1285</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in\\_column\\_group](#)<sup>p1346</sup>", and reprocess the token.

↪ **A start tag whose tag name is "tr"**

Pop the [current template insertion mode](#)<sup>p1285</sup> off the [stack of template insertion modes](#)<sup>p1285</sup>.

Push "[in\\_table\\_body](#)<sup>p1347</sup>" onto the [stack of template insertion modes](#)<sup>p1285</sup> so that it is the new [current template insertion mode](#)<sup>p1285</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in\\_table\\_body](#)<sup>p1347</sup>", and reprocess the token.

↪ **A start tag whose tag name is one of: "td", "th"**

Pop the [current template insertion mode](#)<sup>p1285</sup> off the [stack of template insertion modes](#)<sup>p1285</sup>.

Push "[in\\_row](#)<sup>p1348</sup>" onto the [stack of template insertion modes](#)<sup>p1285</sup> so that it is the new [current template insertion mode](#)<sup>p1285</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in\\_row](#)<sup>p1348</sup>", and reprocess the token.

↪ **Any other start tag**

Pop the [current template insertion mode](#)<sup>p1285</sup> off the [stack of template insertion modes](#)<sup>p1285</sup>.

Push "[in\\_body](#)<sup>p1332</sup>" onto the [stack of template insertion modes](#)<sup>p1285</sup> so that it is the new [current template insertion mode](#)<sup>p1285</sup>.

Switch the [insertion mode](#)<sup>p1285</sup> to "[in\\_body](#)<sup>p1332</sup>", and reprocess the token.

↪ **Any other end tag**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **An end-of-file token**

If there is no [template](#)<sup>p671</sup> element on the [stack of open elements](#)<sup>p1286</sup>, then [stop parsing](#)<sup>p1358</sup>. ([fragment case](#)<sup>p1373</sup>)

Otherwise, this is a [parse error](#)<sup>p1273</sup>.

Pop elements from the [stack of open elements](#)<sup>p1286</sup> until a [template](#)<sup>p671</sup> element has been popped from the stack.

[Clear the list of active formatting elements up to the last marker](#)<sup>p1289</sup>.

Pop the [current template insertion mode](#)<sup>p1285</sup> off the [stack of template insertion modes](#)<sup>p1285</sup>.

[Reset the insertion mode appropriately](#)<sup>p1285</sup>.

Reprocess the token.

#### 13.2.6.4.19 The "after body" insertion mode <sup>§<sup>p13</sup> 53</sup>

When the user agent is to apply the rules for the "[after body](#)<sup>p1353</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in\\_body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup> as the last child of the first element in the [stack of open elements](#)<sup>p1286</sup> (the [html](#)<sup>p172</sup> element).

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in\\_body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **An end tag whose tag name is "html"**

If the parser was created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup>, this is a [parse error](#)<sup>p1273</sup>; ignore the token. ([fragment case](#)<sup>p1373</sup>)

Otherwise, switch the [insertion mode](#)<sup>p1285</sup> to "[after after body](#)<sup>p1355</sup>".

↪ **An end-of-file token**

[Stop parsing](#)<sup>p1358</sup>.

↪ **Anything else**

[Parse error](#)<sup>p1273</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>" and reprocess the token.

#### 13.2.6.4.20 The "in frameset" insertion mode <sup>p13</sup><sub>54</sub>

When the user agent is to apply the rules for the "[in frameset](#)<sup>p1354</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**

[Insert the character](#)<sup>p1323</sup>.

↪ **A comment token**

[Insert a comment](#)<sup>p1324</sup>.

↪ **A DOCTYPE token**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

↪ **A start tag whose tag name is "html"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **A start tag whose tag name is "frameset"**

[Insert an HTML element](#)<sup>p1321</sup> for the token.

↪ **An end tag whose tag name is "frameset"**

If the [current node](#)<sup>p1286</sup> is the root [html](#)<sup>p172</sup> element, then this is a [parse error](#)<sup>p1273</sup>; ignore the token. ([fragment case](#)<sup>p1373</sup>)

Otherwise, pop the [current node](#)<sup>p1286</sup> from the [stack of open elements](#)<sup>p1286</sup>.

If the parser was not created as part of the [HTML fragment parsing algorithm](#)<sup>p1373</sup> ([fragment case](#)<sup>p1373</sup>), and the [current node](#)<sup>p1286</sup> is no longer a [frameset](#)<sup>p1433</sup> element, then switch the [insertion mode](#)<sup>p1285</sup> to "[after frameset](#)<sup>p1355</sup>".

↪ **A start tag whose tag name is "frame"**

[Insert an HTML element](#)<sup>p1321</sup> for the token. Immediately pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, if it is set.

↪ **A start tag whose tag name is "noframes"**

Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.

↪ **An end-of-file token**

If the [current node](#)<sup>p1286</sup> is not the root [html](#)<sup>p172</sup> element, then this is a [parse error](#)<sup>p1273</sup>.

**Note**

The [current node](#)<sup>p1286</sup> can only be the root [html](#)<sup>p172</sup> element in the [fragment case](#)<sup>p1373</sup>.

[Stop parsing](#)<sup>p1358</sup>.

↪ **Anything else**

[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### 13.2.6.4.21 The "after frameset" insertion mode §<sup>p13</sup><sub>55</sub>

When the user agent is to apply the rules for the "[after frameset](#)<sup>p1355</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

- ↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**  
[Insert the character](#)<sup>p1323</sup>.
- ↪ **A comment token**  
[Insert a comment](#)<sup>p1324</sup>.
- ↪ **A DOCTYPE token**  
[Parse error](#)<sup>p1273</sup>. Ignore the token.
- ↪ **A start tag whose tag name is "html"**  
Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.
- ↪ **An end tag whose tag name is "html"**  
Switch the [insertion mode](#)<sup>p1285</sup> to "[after after frameset](#)<sup>p1355</sup>".
- ↪ **A start tag whose tag name is "noframes"**  
Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.
- ↪ **An end-of-file token**  
[Stop parsing](#)<sup>p1358</sup>.
- ↪ **Anything else**  
[Parse error](#)<sup>p1273</sup>. Ignore the token.

#### 13.2.6.4.22 The "after after body" insertion mode §<sup>p13</sup><sub>55</sub>

When the user agent is to apply the rules for the "[after after body](#)<sup>p1355</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

- ↪ **A comment token**  
[Insert a comment](#)<sup>p1324</sup> as the last child of the [Document](#)<sup>p130</sup> object.
- ↪ **A DOCTYPE token**
- ↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**
- ↪ **A start tag whose tag name is "html"**  
Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.
- ↪ **An end-of-file token**  
[Stop parsing](#)<sup>p1358</sup>.
- ↪ **Anything else**  
[Parse error](#)<sup>p1273</sup>. Switch the [insertion mode](#)<sup>p1285</sup> to "[in body](#)<sup>p1332</sup>" and reprocess the token.

#### 13.2.6.4.23 The "after after frameset" insertion mode §<sup>p13</sup><sub>55</sub>

When the user agent is to apply the rules for the "[after after frameset](#)<sup>p1355</sup>" [insertion mode](#)<sup>p1285</sup>, the user agent must handle the token as follows:

- ↪ **A comment token**  
[Insert a comment](#)<sup>p1324</sup> as the last child of the [Document](#)<sup>p130</sup> object.

- ↪ **A DOCTYPE token**
- ↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**
- ↪ **A start tag whose tag name is "html"**  
Process the token [using the rules for](#)<sup>p1285</sup> the "[in body](#)<sup>p1332</sup>" [insertion mode](#)<sup>p1285</sup>.
- ↪ **An end-of-file token**  
[Stop parsing](#)<sup>p1358</sup>.
- ↪ **A start tag whose tag name is "noframes"**  
Process the token [using the rules for](#)<sup>p1285</sup> the "[in head](#)<sup>p1328</sup>" [insertion mode](#)<sup>p1285</sup>.
- ↪ **Anything else**  
[Parse error](#)<sup>p1273</sup>. Ignore the token.

### 13.2.6.5 The rules for parsing tokens in foreign content §<sup>p13</sup> 56

When the user agent is to apply the rules for parsing tokens in foreign content, the user agent must handle the token as follows:

- ↪ **A character token that is U+0000 NULL**  
[Parse error](#)<sup>p1273</sup>. [Insert a U+FFFD REPLACEMENT CHARACTER character](#)<sup>p1323</sup>.
- ↪ **A character token that is one of U+0009 CHARACTER TABULATION, U+000A LINE FEED (LF), U+000C FORM FEED (FF), U+000D CARRIAGE RETURN (CR), or U+0020 SPACE**  
[Insert the token's character](#)<sup>p1323</sup>.
- ↪ **Any other character token**  
[Insert the token's character](#)<sup>p1323</sup>.  
  
Set the [frameset-ok flag](#)<sup>p1290</sup> to "not ok".
- ↪ **A comment token**  
[Insert a comment](#)<sup>p1324</sup>.
- ↪ **A DOCTYPE token**  
[Parse error](#)<sup>p1273</sup>. Ignore the token.
- ↪ **A start tag whose tag name is one of: "b", "big", "blockquote", "body", "br", "center", "code", "dd", "div", "dl", "dt", "em", "embed", "h1", "h2", "h3", "h4", "h5", "h6", "head", "hr", "i", "img", "li", "listing", "menu", "meta", "nobr", "ol", "p", "pre", "ruby", "s", "small", "span", "strong", "strike", "sub", "sup", "table", "tt", "u", "ul", "var"**
- ↪ **A start tag whose tag name is "font", if the token has any attributes named "color", "face", or "size"**
- ↪ **An end tag whose tag name is "br", "p"**  
[Parse error](#)<sup>p1273</sup>.

While the [current node](#)<sup>p1286</sup> is not a [MathML text integration point](#)<sup>p1319</sup>, an [HTML integration point](#)<sup>p1319</sup>, or an element in the [HTML namespace](#), pop elements from the [stack of open elements](#)<sup>p1286</sup>.

Reprocess the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>p1285</sup> in HTML content.

- ↪ **Any other start tag**  
If the [adjusted current node](#)<sup>p1287</sup> is an element in the [MathML namespace](#), [adjust MathML attributes](#)<sup>p1322</sup> for the token. (This fixes the case of MathML attributes that are not all lowercase.)  
  
If the [adjusted current node](#)<sup>p1287</sup> is an element in the [SVG namespace](#), and the token's tag name is one of the ones in the first column of the following table, change the tag name to the name given in the corresponding cell in the second column. (This fixes the case of SVG elements that are not all lowercase.)

Tag name	Element name
altglyph	altGlyph

Tag name	Element name
altglyphdef	altGlyphDef
altglyphitem	altGlyphItem
animatecolor	animateColor
animatemotion	animateMotion
animatetransform	animateTransform
clippath	clipPath
feblend	feBlend
fecolormatrix	feColorMatrix
fecomponenttransfer	feComponentTransfer
fecomposite	feComposite
feconvolvematrix	feConvolveMatrix
fediffuselighting	feDiffuseLighting
fedisplacementmap	feDisplacementMap
fedistantlight	feDistantLight
fedropshadow	feDropShadow
feflood	feFlood
fefunca	feFuncA
fefuncb	feFuncB
fefuncg	feFuncG
fefuncr	feFuncR
fegaussianblur	feGaussianBlur
feimage	feImage
femerge	feMerge
femergenode	feMergeNode
femorphology	feMorphology
feoffset	feOffset
fepointlight	fePointLight
fespecularlighting	feSpecularLighting
fespotlight	feSpotLight
fetile	feTile
feturbulence	feTurbulence
foreignobject	foreignObject
glyphref	glyphRef
lineargradient	linearGradient
radialgradient	radialGradient
textpath	textPath

If the [adjusted current node](#)<sup>p1287</sup> is an element in the [SVG namespace](#), [adjust SVG attributes](#)<sup>p1322</sup> for the token. (This fixes the case of SVG attributes that are not all lowercase.)

[Adjust foreign attributes](#)<sup>p1323</sup> for the token. (This fixes the use of namespaced attributes, in particular XLink in SVG.)

[Insert a foreign element](#)<sup>p1321</sup> for the token, with [adjusted current node](#)<sup>p1287</sup>'s namespace and false.

If the token has its [self-closing flag](#)<sup>p1290</sup> set, then run the appropriate steps from the following list:

↪ If the token's tag name is "script", and the new [current node](#)<sup>p1286</sup> is in the [SVG namespace](#)  
[Acknowledge the token's self-closing flag](#)<sup>p1290</sup>, and then act as described in the steps for a "script" end tag below.

↪ Otherwise

Pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup> and [acknowledge the token's self-closing flag](#)<sup>p1290</sup>.

↪ An end tag whose tag name is "script", if the [current node](#)<sup>p1286</sup> is an [SVG script](#) element

Pop the [current node](#)<sup>p1286</sup> off the [stack of open elements](#)<sup>p1286</sup>.

Let the *old insertion point* have the same value as the current [insertion point](#)<sup>p1285</sup>. Let the [insertion point](#)<sup>p1285</sup> be just before the [next input character](#)<sup>p1285</sup>.

Increment the parser's [script nesting level](#)<sup>p1273</sup> by one. Set the [parser pause flag](#)<sup>p1273</sup> to true.

If the [active speculative HTML parser](#)<sup>p1360</sup> is null and the user agent supports SVG, then [Process the SVG script element](#) according to the SVG rules. [\[SVG\]](#)<sup>p1482</sup>

#### Note

*Even if this causes [new characters to be inserted into the tokenizer](#)<sup>p1153</sup>, the parser will not be executed reentrantly, since the [parser pause flag](#)<sup>p1273</sup> is true.*

Decrement the parser's [script nesting level](#)<sup>p1273</sup> by one. If the parser's [script nesting level](#)<sup>p1273</sup> is zero, then set the [parser pause flag](#)<sup>p1273</sup> to false.

Let the [insertion point](#)<sup>p1285</sup> have the value of the *old insertion point*. (In other words, restore the [insertion point](#)<sup>p1285</sup> to its previous value. This value might be the "undefined" value.)

#### ↪ Any other end tag

Run these steps:

1. Initialize *node* to be the [current node](#)<sup>p1286</sup> (the bottommost node of the stack).
2. If *node*'s tag name, [converted to ASCII lowercase](#), is not the same as the tag name of the token, then this is a [parse error](#)<sup>p1273</sup>.
3. *Loop*: If *node* is the topmost element in the [stack of open elements](#)<sup>p1286</sup>, then return. ([fragment case](#)<sup>p1373</sup>)
4. If *node*'s tag name, [converted to ASCII lowercase](#), is the same as the tag name of the token, pop elements from the [stack of open elements](#)<sup>p1286</sup> until *node* has been popped from the stack, and then return.
5. Set *node* to the previous entry in the [stack of open elements](#)<sup>p1286</sup>.
6. If *node* is not an element in the [HTML namespace](#), return to the step labeled *loop*.
7. Otherwise, process the token according to the rules given in the section corresponding to the current [insertion mode](#)<sup>p1285</sup> in HTML content.

### 13.2.7 The end <sup>p13</sup><sub>58</sub>

Once the user agent **stops parsing** the document, the user agent must run the following steps:

1. If the [active speculative HTML parser](#)<sup>p1360</sup> is not null, then [stop the speculative HTML parser](#)<sup>p1361</sup> and return.
2. Set the [insertion point](#)<sup>p1285</sup> to undefined.
3. [Update the current document readiness](#)<sup>p133</sup> to "interactive".
4. Pop *all* the nodes off the [stack of open elements](#)<sup>p1286</sup>.
5. While the [list of scripts that will execute when the document has finished parsing](#)<sup>p665</sup> is not empty:
  1. [Spin the event loop](#)<sup>p1131</sup> until the first [script](#)<sup>p652</sup> in the [list of scripts that will execute when the document has finished parsing](#)<sup>p665</sup> has its [ready to be parser-executed](#)<sup>p659</sup> set to true *and* the parser's [Document](#)<sup>p130</sup> has no style sheet that is blocking scripts<sup>p204</sup>.
  2. [Execute the script element](#)<sup>p665</sup> given by the first [script](#)<sup>p652</sup> in the [list of scripts that will execute when the document has finished parsing](#)<sup>p665</sup>.
  3. Remove the first [script](#)<sup>p652</sup> element from the [list of scripts that will execute when the document has finished parsing](#)<sup>p665</sup> (i.e. shift out the first entry in the list).
6. [Queue a global task](#)<sup>p1125</sup> on the [DOM manipulation task source](#)<sup>p1134</sup> given the [Document](#)<sup>p130</sup>'s [relevant global object](#)<sup>p1083</sup> to run the following substeps:
  1. Set the [Document](#)<sup>p130</sup>'s [load timing info](#)<sup>p134</sup>'s [DOM content loaded event start time](#)<sup>p134</sup> to the [current high resolution](#)

time given the [Document](#)<sup>p130</sup>'s [relevant global object](#)<sup>p1083</sup>.

2. [Fire an event](#) named [DOMContentLoaded](#)<sup>p1471</sup> at the [Document](#)<sup>p130</sup> object, with its [bubbles](#) attribute initialized to true.
3. Set the [Document](#)<sup>p130</sup>'s [load timing info](#)<sup>p134</sup>'s [DOM content loaded event end time](#)<sup>p134</sup> to the [current high resolution time](#) given the [Document](#)<sup>p130</sup>'s [relevant global object](#)<sup>p1083</sup>.
4. Enable the [client message queue](#) of the [ServiceWorkerContainer](#) object whose associated [service worker client](#) is the [Document](#)<sup>p130</sup> object's [relevant settings object](#)<sup>p1083</sup>.
5. Invoke [WebDriver BiDi DOM content loaded](#) with the [Document](#)<sup>p130</sup>'s [browsing context](#)<sup>p999</sup>, and a new [WebDriver BiDi navigation status](#) whose [id](#) is the [Document](#)<sup>p130</sup> object's [during-loading navigation ID for WebDriver BiDi](#)<sup>p131</sup>, [status](#) is ["pending"](#), and [url](#) is the [Document](#)<sup>p130</sup> object's [URL](#).
7. [Spin the event loop](#)<sup>p1131</sup> until the [set of scripts that will execute as soon as possible](#)<sup>p665</sup> and the [list of scripts that will execute in order as soon as possible](#)<sup>p665</sup> are empty.
8. [Spin the event loop](#)<sup>p1131</sup> until there is nothing that **delays the load event** in the [Document](#)<sup>p130</sup>.
9. [Queue a global task](#)<sup>p1125</sup> on the [DOM manipulation task source](#)<sup>p1134</sup> given the [Document](#)<sup>p130</sup>'s [relevant global object](#)<sup>p1083</sup> to run the following steps:
  1. [Update the current document readiness](#)<sup>p133</sup> to ["complete"](#).
  2. If the [Document](#)<sup>p130</sup> object's [browsing context](#)<sup>p999</sup> is null, then abort these steps.
  3. Let *window* be the [Document](#)<sup>p130</sup>'s [relevant global object](#)<sup>p1083</sup>.
  4. Set the [Document](#)<sup>p130</sup>'s [load timing info](#)<sup>p134</sup>'s [load event start time](#)<sup>p134</sup> to the [current high resolution time](#) given *window*.
  5. [Fire an event](#) named [load](#)<sup>p1471</sup> at *window*, with *legacy target override flag* set.
  6. Invoke [WebDriver BiDi load complete](#) with the [Document](#)<sup>p130</sup>'s [browsing context](#)<sup>p999</sup>, and a new [WebDriver BiDi navigation status](#) whose [id](#) is the [Document](#)<sup>p130</sup> object's [during-loading navigation ID for WebDriver BiDi](#)<sup>p131</sup>, [status](#) is ["complete"](#), and [url](#) is the [Document](#)<sup>p130</sup> object's [URL](#).
  7. Set the [Document](#)<sup>p130</sup> object's [during-loading navigation ID for WebDriver BiDi](#)<sup>p131</sup> to null.
  8. Set the [Document](#)<sup>p130</sup>'s [load timing info](#)<sup>p134</sup>'s [load event end time](#)<sup>p134</sup> to the [current high resolution time](#) given *window*.
  9. [Assert](#): [Document](#)<sup>p130</sup>'s [page showing](#)<sup>p1064</sup> is false.
  10. Set the [Document](#)<sup>p130</sup>'s [page showing](#)<sup>p1064</sup> flag to true.
  11. [Fire a page transition event](#)<sup>p983</sup> named [pageshow](#)<sup>p1472</sup> at *window* with false.
  12. [Completely finish loading](#)<sup>p1063</sup> the [Document](#)<sup>p130</sup>.
  13. [Queue the navigation timing entry](#) for the [Document](#)<sup>p130</sup>.
10. If the [Document](#)<sup>p130</sup>'s [print when loaded](#)<sup>p1169</sup> flag is set, then run the [printing steps](#)<sup>p1169</sup>.
11. The [Document](#)<sup>p130</sup> is now **ready for post-load tasks**.

When the user agent is to **abort a parser**, it must run the following steps:

1. Throw away any pending content in the [input stream](#)<sup>p1284</sup>, and discard any future content that would have been added to it.
2. [Stop the speculative HTML parser](#)<sup>p1361</sup> for this HTML parser.
3. [Update the current document readiness](#)<sup>p133</sup> to ["interactive"](#).
4. Pop *all* the nodes off the [stack of open elements](#)<sup>p1286</sup>.
5. [Update the current document readiness](#)<sup>p133</sup> to ["complete"](#).

### 13.2.8 Speculative HTML parsing <sup>§ p13</sup> <sup>60</sup>

User agents may implement an optimization, as described in this section, to speculatively fetch resources that are declared in the HTML markup while the HTML parser is waiting for a [pending parsing-blocking script](#)<sup>p665</sup> to be fetched and executed, or during normal parsing, at the time [an element is created for a token](#)<sup>p1320</sup>. While this optimization is not defined in precise detail, there are some rules to consider for interoperability.

Each [HTML parser](#)<sup>p1271</sup> can have an **active speculative HTML parser**. It is initially null.

The **speculative HTML parser** must act like the normal HTML parser (e.g., the tree builder rules apply), with some exceptions:

- The state of the normal HTML parser and the document itself must not be affected.

#### Example

For example, the [next input character](#)<sup>p1285</sup> or the [stack of open elements](#)<sup>p1286</sup> for the normal HTML parser is not affected by the [speculative HTML parser](#)<sup>p1360</sup>.

- Bytes pushed into the HTML parser's [input byte stream](#)<sup>p1277</sup> must also be pushed into the speculative HTML parser's [input byte stream](#)<sup>p1277</sup>. Bytes read from the streams must be independent.
- The result of the speculative parsing is primarily a series of [speculative fetches](#)<sup>p1360</sup>. Which kinds of resources to speculatively fetch is [implementation-defined](#), but user agents must not speculatively fetch resources that would not be fetched with the normal HTML parser, under the assumption that the script that is blocking the HTML parser does nothing.

#### Note

*It is possible that the same markup is seen multiple times from the [speculative HTML parser](#)<sup>p1360</sup> and then the normal HTML parser. It is expected that duplicated fetches will be prevented by caching rules, which are not yet fully specified.*

A **speculative fetch** for a [speculative mock element](#)<sup>p1361</sup> *element* must follow these rules:

Should some of these things be applied to the document "for real", even though they are found speculatively?

- If the [speculative HTML parser](#)<sup>p1360</sup> encounters one of the following elements, then act as if that element is processed for the purpose of its effect of subsequent speculative fetches.
  - A [base](#)<sup>p175</sup> element.
  - A [meta](#)<sup>p189</sup> element whose [http-equiv](#)<sup>p195</sup> attribute is in the [Content security policy](#)<sup>p199</sup> state.
  - A [meta](#)<sup>p189</sup> element whose [name](#)<sup>p198</sup> attribute is an [ASCII case-insensitive](#) match for "[referrer](#)<sup>p192</sup>".
  - A [meta](#)<sup>p189</sup> element whose [name](#)<sup>p198</sup> attribute is an [ASCII case-insensitive](#) match for "viewport". (This can affect whether a media query list [matches the environment](#)<sup>p95</sup>.) [\[CSSDEVICEADAPT\]](#)<sup>p1476</sup>
- Let *url* be the [URL](#) that *element* would fetch if it was processed normally. If there is no such [URL](#) or if it is the empty string, then do nothing. Otherwise, if *url* is already in the [list of speculative fetch URLs](#)<sup>p1360</sup>, then do nothing. Otherwise, fetch *url* as if the element was processed normally, and add *url* to the [list of speculative fetch URLs](#)<sup>p1360</sup>.

Each [Document](#)<sup>p138</sup> has a **list of speculative fetch URLs**, which is a [list](#) of [URLs](#), initially empty.

To **start the speculative HTML parser** for an instance of an HTML parser *parser*:

1. Optionally, return.

#### Note

*This step allows user agents to opt out of speculative HTML parsing.*

2. If *parser*'s [active speculative HTML parser](#)<sup>p1360</sup> is not null, then [stop the speculative HTML parser](#)<sup>p1361</sup> for *parser*.

#### Note

*This can happen when `document.write()`<sup>p1153</sup> writes another parser-blocking script. For simplicity, this specification always restarts speculative parsing, but user agents can implement a more efficient strategy, so long as the end result is equivalent.*

3. Let *speculativeParser* be a new [speculative HTML parser](#)<sup>p1360</sup>, with the same state as *parser*.
4. Let *speculativeDoc* be a new isomorphic representation of *parser*'s [Document](#)<sup>p138</sup>, where all elements are instead [speculative](#)

[mock elements](#)<sup>p1361</sup>. Let *speculativeParser* parse into *speculativeDoc*.

5. Set *parser*'s [active speculative HTML parser](#)<sup>p1360</sup> to *speculativeParser*.
6. [In parallel](#)<sup>p43</sup>, run *speculativeParser* until it is stopped or until it reaches the end of its [input stream](#)<sup>p1284</sup>.

To **stop the speculative HTML parser** for an instance of an HTML parser *parser*:

1. Let *speculativeParser* be *parser*'s [active speculative HTML parser](#)<sup>p1360</sup>.
2. If *speculativeParser* is null, then return.
3. Throw away any pending content in *speculativeParser*'s [input stream](#)<sup>p1284</sup>, and discard any future content that would have been added to it.
4. Set *parser*'s [active speculative HTML parser](#)<sup>p1360</sup> to null.

The [speculative HTML parser](#)<sup>p1360</sup> will create [speculative mock elements](#)<sup>p1361</sup> instead of normal elements. DOM operations that the tree builder normally does on elements are expected to work appropriately on speculative mock elements.

A **speculative mock element** is a [struct](#) with the following [items](#):

- A [string namespace](#), corresponding to an element's [namespace](#).
- A [string local name](#), corresponding to an element's [local name](#).
- A [list attribute list](#), corresponding to an element's [attribute list](#).
- A [list children](#), corresponding to an element's [children](#).

To **create a speculative mock element** given a *namespace*, *tagName*, and *attributes*:

1. Let *element* be a new [speculative mock element](#)<sup>p1361</sup>.
2. Set *element*'s [namespace](#)<sup>p1361</sup> to *namespace*.
3. Set *element*'s [local name](#)<sup>p1361</sup> to *tagName*.
4. Set *element*'s [attribute list](#)<sup>p1361</sup> to *attributes*.
5. Set *element*'s [children](#)<sup>p1361</sup> to a new empty [list](#).
6. Optionally, perform a [speculative fetch](#)<sup>p1360</sup> for *element*.
7. Return *element*.

When the tree builder says to insert an element into a [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup>, if that is a [speculative mock element](#)<sup>p1361</sup>, and the [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup> is not a [ShadowRoot](#) node, instead do nothing. URLs found speculatively inside non-declarative-shadow-root [template](#)<sup>p671</sup> elements might themselves be templates, and must not be speculatively fetched.

### 13.2.9 Coercing an HTML DOM into an infoset § p13 61

When an application uses an [HTML parser](#)<sup>p1271</sup> in conjunction with an XML pipeline, it is possible that the constructed DOM is not compatible with the XML tool chain in certain subtle ways. For example, an XML toolchain might not be able to represent attributes with the name `xmlns`, since they conflict with the Namespaces in XML syntax. There is also some data that the [HTML parser](#)<sup>p1271</sup> generates that isn't included in the DOM itself. This section specifies some rules for handling these issues.

If the XML API being used doesn't support DOCTYPEs, the tool may drop DOCTYPEs altogether.

If the XML API doesn't support attributes in no namespace that are named "xmlns", attributes whose names start with "xmlns:", or attributes in the [XMLNS namespace](#), then the tool may drop such attributes.

The tool may annotate the output with any namespace declarations required for proper operation.

If the XML API being used restricts the allowable characters in the local names of elements and attributes, then the tool may map all

element and attribute local names that the API wouldn't support to a set of names that *are* allowed, by replacing any character that isn't supported with the uppercase letter U and the six digits of the character's code point when expressed in hexadecimal, using digits 0-9 and capital letters A-F as the symbols, in increasing numeric order.

#### Example

For example, the element name `foo<bar`, which can be output by the [HTML parser](#)<sup>p1271</sup>, though it is neither a legal HTML element name nor a well-formed XML element name, would be converted into `fooU00003Cbar`, which *is* a well-formed XML element name (though it's still not legal in HTML by any means).

#### Example

As another example, consider the attribute `xlink:href`. Used on a MathML element, it becomes, after being [adjusted](#)<sup>p1323</sup>, an attribute with a prefix "xlink" and a local name "href". However, used on an HTML element, it becomes an attribute with no prefix and the local name "xlink:href", which is not a valid NCName, and thus might not be accepted by an XML API. It could thus get converted, becoming "xlinkU00003Ahref".

#### Note

*The resulting names from this conversion conveniently can't clash with any attribute generated by the [HTML parser](#)<sup>p1271</sup>, since those are all either lowercase or those listed in the [adjust foreign attributes](#)<sup>p1323</sup> algorithm's table.*

If the XML API restricts comments from having two consecutive U+002D HYPHEN-MINUS characters (--), the tool may insert a single U+0020 SPACE character between any such offending characters.

If the XML API restricts comments from ending in a U+002D HYPHEN-MINUS character (-), the tool may insert a single U+0020 SPACE character at the end of such comments.

If the XML API restricts allowed characters in character data, attribute values, or comments, the tool may replace any U+000C FORM FEED (FF) character with a U+0020 SPACE character, and any other literal non-XML character with a U+FFFD REPLACEMENT CHARACTER.

If the tool has no way to convey out-of-band information, then the tool may drop the following information:

- Whether the document is set to [no-quirks mode](#), [limited-quirks mode](#), or [quirks mode](#)
- The association between form controls and forms that aren't their nearest [form](#)<sup>p514</sup> element ancestor (use of the [form element pointer](#)<sup>p1289</sup> in the parser)
- The [template contents](#)<sup>p673</sup> of any [template](#)<sup>p671</sup> elements.

#### Note

*The mutations allowed by this section apply after the [HTML parser](#)<sup>p1271</sup>'s rules have been applied. For example, a `<a: :>` start tag will be closed by a `</a: :>` end tag, and never by a `</aU00003AU00003A>` end tag, even if the user agent is using the rules above to then generate an actual element in the DOM with the name `aU00003AU00003A` for that start tag.*

### 13.2.10 An introduction to error handling and strange cases in the parser §<sup>p13</sup> 62

*This section is non-normative.*

This section examines some erroneous markup and discusses how the [HTML parser](#)<sup>p1271</sup> handles these cases.

#### 13.2.10.1 Misnested tags: `<b><i></b></i>` §<sup>p13</sup> 62

*This section is non-normative.*

The most-often discussed example of erroneous markup is as follows:

```
<p>1<b>2<i>3</b>4</i>5</p>
```

The parsing of this markup is straightforward up to the "3". At this point, the DOM looks like this:

Here, the [stack of open elements](#)<sup>p1286</sup> has five elements on it: [html](#)<sup>p172</sup>, [body](#)<sup>p205</sup>, [p](#)<sup>p229</sup>, [b](#)<sup>p292</sup>, and [i](#)<sup>p291</sup>. The [list of active formatting elements](#)<sup>p1288</sup> just has two: [b](#)<sup>p292</sup> and [i](#)<sup>p291</sup>. The [insertion mode](#)<sup>p1285</sup> is "[in body](#)<sup>p1332</sup>".

Upon receiving the end tag token with the tag name "b", the "[adoption agency algorithm](#)<sup>p1340</sup>" is invoked. This is a simple case, in that the *formattingElement* is the [b](#)<sup>p292</sup> element, and there is no *furthest block*. Thus, the [stack of open elements](#)<sup>p1286</sup> ends up with just three elements: [html](#)<sup>p172</sup>, [body](#)<sup>p205</sup>, and [p](#)<sup>p229</sup>, while the [list of active formatting elements](#)<sup>p1288</sup> has just one: [i](#)<sup>p291</sup>. The DOM tree is unmodified at this point.

The next token is a character ("4"), triggers the [reconstruction of the active formatting elements](#)<sup>p1289</sup>, in this case just the [i](#)<sup>p291</sup> element. A new [i](#)<sup>p291</sup> element is thus created for the "4" *Text* node. After the end tag token for the "i" is also received, and the "5" *Text* node is inserted, the DOM looks as follows:

### 13.2.10.2 Misnested tags: `<b><p></b></p>` § p1363

*This section is non-normative.*

A case similar to the previous one is the following:

```
<b>1<p>2</b>3</p>
```

Up to the "2" the parsing here is straightforward:

The interesting part is when the end tag token with the tag name "b" is parsed.

Before that token is seen, the [stack of open elements](#)<sup>p1286</sup> has four elements on it: [html](#)<sup>p172</sup>, [body](#)<sup>p205</sup>, [b](#)<sup>p292</sup>, and [p](#)<sup>p229</sup>. The [list of active formatting elements](#)<sup>p1288</sup> just has the one: [b](#)<sup>p292</sup>. The [insertion mode](#)<sup>p1285</sup> is "[in body](#)<sup>p1332</sup>".

Upon receiving the end tag token with the tag name "b", the "[adoption agency algorithm](#)<sup>p1340</sup>" is invoked, as in the previous example.

However, in this case, there is a *furthest block*, namely the **p<sup>p229</sup>** element. Thus, this time the adoption agency algorithm isn't skipped over.

The *common ancestor* is the **body<sup>p205</sup>** element. A conceptual "bookmark" marks the position of the **b<sup>p292</sup>** in the [list of active formatting elements<sup>p1288</sup>](#), but since that list has only one element in it, the bookmark won't have much effect.

As the algorithm progresses, *node* ends up set to the formatting element (**b<sup>p292</sup>**), and *last node* ends up set to the *furthest block* (**p<sup>p229</sup>**).

The *last node* gets appended (moved) to the *common ancestor*, so that the DOM looks like:

```
L htmlp172
  L headp173
  L bodyp205
    L bp292
      L #text: 1
    L pp229
      L #text: 2
```

A new **b<sup>p292</sup>** element is created, and the children of the **p<sup>p229</sup>** element are moved to it:

```
L htmlp172
  L headp173
  L bodyp205
    L bp292
      L #text: 1
    L pp229
  L bp292
    L #text: 2
```

Finally, the new **b<sup>p292</sup>** element is appended to the **p<sup>p229</sup>** element, so that the DOM looks like:

```
L htmlp172
  L headp173
  L bodyp205
    L bp292
      L #text: 1
    L pp229
      L bp292
        L #text: 2
```

The **b<sup>p292</sup>** element is removed from the [list of active formatting elements<sup>p1288</sup>](#) and the [stack of open elements<sup>p1286</sup>](#), so that when the "3" is parsed, it is appended to the **p<sup>p229</sup>** element:

```
L htmlp172
  L headp173
  L bodyp205
    L bp292
      L #text: 1
    L pp229
      L bp292
        L #text: 2
      L #text: 3
```

### 13.2.10.3 Unexpected markup in tables § p13 64

*This section is non-normative.*

Error handling in tables is, for historical reasons, especially strange. For example, consider the following markup:

```
<table><b><tr><td>aaa</td></tr>bbb</table>ccc
```

The highlighted `bp292` element start tag is not allowed directly inside a table like that, and the parser handles this case by placing the element *before* the table. (This is called *foster parenting<sup>p1319</sup>*.) This can be seen by examining the DOM tree as it stands just after the `tablep478` element's start tag has been seen:

```
L htmlp172
  |
  | headp173
  |
  | bodyp205
  |
  | tablep478
```

...and then immediately after the `bp292` element start tag has been seen:

```
L htmlp172
  |
  | headp173
  |
  | bodyp205
  |
  | bp292
  |
  | tablep478
```

At this point, the *stack of open elements<sup>p1286</sup>* has on it the elements `htmlp172`, `bodyp205`, `tablep478`, and `bp292` (in that order, despite the resulting DOM tree); the *list of active formatting elements<sup>p1288</sup>* just has the `bp292` element in it; and the *insertion mode<sup>p1285</sup>* is "*in table<sup>p1343</sup>*".

The `trp492` start tag causes the `bp292` element to be popped off the stack and a `tbodyp489` start tag to be implied; the `tbodyp489` and `trp492` elements are then handled in a rather straight-forward manner, taking the parser through the "*in table body<sup>p1347</sup>*" and "*in row<sup>p1348</sup>*" insertion modes, after which the DOM looks as follows:

```
L htmlp172
  |
  | headp173
  |
  | bodyp205
  |
  | bp292
  |
  | tablep478
  |
  | tbodyp489
  |
  | trp492
```

Here, the *stack of open elements<sup>p1286</sup>* has on it the elements `htmlp172`, `bodyp205`, `tablep478`, `tbodyp489`, and `trp492`; the *list of active formatting elements<sup>p1288</sup>* still has the `bp292` element in it; and the *insertion mode<sup>p1285</sup>* is "*in row<sup>p1348</sup>*".

The `tdp493` element start tag token, after putting a `tdp493` element on the tree, puts a *marker<sup>p1288</sup>* on the *list of active formatting elements<sup>p1288</sup>* (it also switches to the "*in cell<sup>p1349</sup>*" *insertion mode<sup>p1285</sup>*).

```
L htmlp172
  |
  | headp173
  |
  | bodyp205
  |
  | bp292
  |
  | tablep478
  |
  | tbodyp489
  |
  | trp492
  |
  | tdp493
```

The *marker<sup>p1288</sup>* means that when the "aaa" character tokens are seen, no `bp292` element is created to hold the resulting *Text* node:

```
L htmlp172
  |
  | headp173
  |
  | bodyp205
  |
  | bp292
  |
  | tablep478
  |
  | tbodyp489
  |
  | trp492
  |
  | tdp493
  |
  | #text: aaa
```

The end tags are handled in a straight-forward manner; after handling them, the *stack of open elements<sup>p1286</sup>* has on it the elements `htmlp172`, `bodyp205`, `tablep478`, and `tbodyp489`; the *list of active formatting elements<sup>p1288</sup>* still has the `bp292` element in it (the *marker<sup>p1288</sup>* having been removed by the "td" end tag token); and the *insertion mode<sup>p1285</sup>* is "*in table body<sup>p1347</sup>*".

Thus it is that the "bbb" character tokens are found. These trigger the "[in table text](#)<sup>p1345</sup>" insertion mode to be used (with the [original insertion mode](#)<sup>p1285</sup> set to "[in table body](#)<sup>p1347</sup>"). The character tokens are collected, and when the next token (the [table](#)<sup>p478</sup> element end tag) is seen, they are processed as a group. Since they are not all spaces, they are handled as per the "anything else" rules in the "[in table](#)<sup>p1343</sup>" insertion mode, which defer to the "[in body](#)<sup>p1332</sup>" insertion mode but with [foster parenting](#)<sup>p1319</sup>.

When [the active formatting elements are reconstructed](#)<sup>p1289</sup>, a [b](#)<sup>p292</sup> element is created and [foster parented](#)<sup>p1319</sup>, and then the "bbb" [Text](#) node is appended to it:

The [stack of open elements](#)<sup>p1286</sup> has on it the elements [html](#)<sup>p172</sup>, [body](#)<sup>p205</sup>, [table](#)<sup>p478</sup>, [tbody](#)<sup>p489</sup>, and the new [b](#)<sup>p292</sup> (again, note that this doesn't match the resulting tree!); the [list of active formatting elements](#)<sup>p1288</sup> has the new [b](#)<sup>p292</sup> element in it; and the [insertion mode](#)<sup>p1285</sup> is still "[in table body](#)<sup>p1347</sup>".

Had the character tokens been only [ASCII whitespace](#) instead of "bbb", then that [ASCII whitespace](#) would just be appended to the [tbody](#)<sup>p489</sup> element.

Finally, the [table](#)<sup>p478</sup> is closed by a "table" end tag. This pops all the nodes from the [stack of open elements](#)<sup>p1286</sup> up to and including the [table](#)<sup>p478</sup> element, but it doesn't affect the [list of active formatting elements](#)<sup>p1288</sup>, so the "ccc" character tokens after the table result in yet another [b](#)<sup>p292</sup> element being created, this time after the table:

#### 13.2.10.4 Scripts that modify the page as it is being parsed <sup>§<sup>p13</sup> 66</sup>

*This section is non-normative.*

Consider the following markup, which for this example we will assume is the document with [URL](#) <https://example.com/inner>, being rendered as the content of an [iframe](#)<sup>p390</sup> in another document with the [URL](#) <https://example.com/outer>:

```

<div id=a>
  <script>
    var div = document.getElementById('a');
    parent.document.body.appendChild(div);
  </script>
  <script>
    alert(document.URL);
  </script>
</div>

```

```
<script>
  alert(document.URL);
</script>
```

Up to the first "script" end tag, before the script is parsed, the result is relatively straightforward:

```

L htmlp172
  L headp173
  L bodyp205
    L divp256 idp154="a"
      L #text:
        L scriptp652
          L #text: var div = document.getElementById('a'); ⚡ parent.document.body.appendChild(div);
```

After the script is parsed, though, the `divp256` element and its child `scriptp652` element are gone:

```

L htmlp172
  L headp173
  L bodyp205
```

They are, at this point, in the `Documentp130` of the aforementioned outer `browsing contextp998`. However, the `stack of open elementsp1286` still contains the `divp256` element.

Thus, when the second `scriptp652` element is parsed, it is inserted *into the outer* `Documentp130` object.

Those parsed into different `Documentp130`s than the one the parser was created for do not execute, so the first alert does not show.

Once the `divp256` element's end tag is parsed, the `divp256` element is popped off the stack, and so the next `scriptp652` element is in the inner `Documentp130`:

```

L htmlp172
  L headp173
  L bodyp205
    L scriptp652
      L #text: alert(document.URL);
```

This script does execute, resulting in an alert that says "https://example.com/inner".

### 13.2.10.5 The execution of scripts that are moving across multiple documents §<sup>p13</sup> 67

*This section is non-normative.*

Elaborating on the example in the previous section, consider the case where the second `scriptp652` element is an external script (i.e. one with a `srcp654` attribute). Since the element was not in the parser's `Documentp130` when it was created, that external script is not even downloaded.

In a case where a `scriptp652` element with a `srcp654` attribute is parsed normally into its parser's `Documentp130`, but while the external script is being downloaded, the element is moved to another document, the script continues to download, but does not execute.

#### Note

*In general, moving `scriptp652` elements between `Documentp130`s is considered a bad practice.*

### 13.2.10.6 Unclosed formatting elements §<sup>p13</sup> 67

*This section is non-normative.*

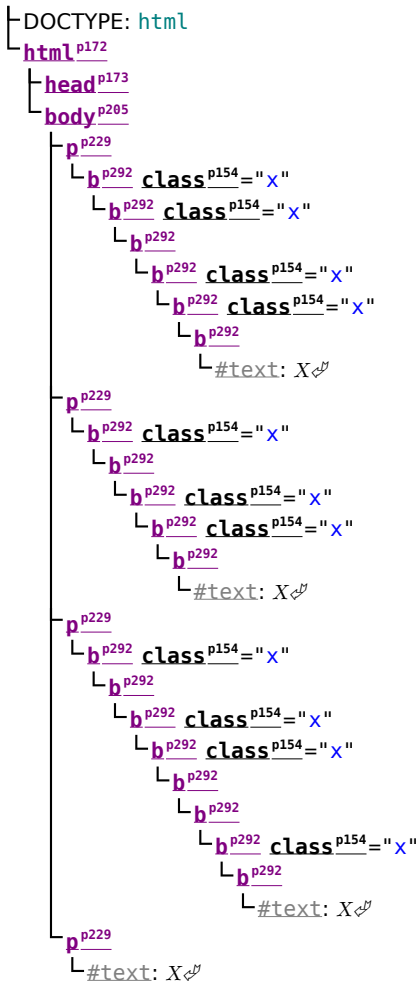

The following markup shows how nested formatting elements (such as `bp292`) get collected and continue to be applied even as the elements they are contained in are closed, but that excessive duplicates are thrown away.

```

<!DOCTYPE html>
<p><b class=x><b class=x><b><b class=x><b class=x><b>X
<p>X
<p><b><b class=x><b>X
<p></b></b></b></b></b></b></b>X

```

The resulting DOM tree is as follows:

Note how the second [p<sup>p229</sup>](#) element in the markup has no explicit [b<sup>p292</sup>](#) elements, but in the resulting DOM, up to three of each kind of formatting element (in this case three [b<sup>p292</sup>](#) elements with the class attribute, and two unadorned [b<sup>p292</sup>](#) elements) get reconstructed before the element's "X".

Also note how this means that in the final paragraph only six [b<sup>p292</sup>](#) end tags are needed to completely clear the [list of active formatting elements<sup>p1288</sup>](#), even though nine [b<sup>p292</sup>](#) start tags have been seen up to this point.

### 13.3 Serializing HTML fragments §<sup>p13</sup> 68

For the purposes of the following algorithm, an element **serializes as void** if its element type is one of the [void elements<sup>p1260</sup>](#), or is [basefont<sup>p1427</sup>](#), [bgsound<sup>p1426</sup>](#), [frame<sup>p1433</sup>](#), [keygen<sup>p1426</sup>](#), or [param<sup>p1426</sup>](#).

The following steps form the **HTML fragment serialization algorithm**. The algorithm takes as input a DOM [Element](#), [Document<sup>p130</sup>](#), or [DocumentFragment](#) referred to as *the node*, a boolean *serializableShadowRoots*, and a sequence<ShadowRoot> *shadowRoots*, and returns a string.

#### Note

*This algorithm serializes the children of the node being serialized, not the node itself.*

1. If the node [serializes as void](#)<sup>p1368</sup>, then return the empty string.
2. Let *s* be a string, and initialize it to the empty string.
3. If the node is a [template](#)<sup>p671</sup> element, then let *the node* instead be the [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup> (a [DocumentFragment](#) node).
4. If *current node* is a [shadow host](#), then:

1. Let *shadow* be *current node*'s [shadow root](#).
2. If one of the following is true:
  - *serializableShadowRoots* is true and *shadow*'s [serializable](#) is true; or
  - *shadowRoots* contains *shadow*,

then:

1. Append "<template shadowrootmode="".
2. If *shadow*'s [mode](#) is "open", then append "open". Otherwise, append "closed".
3. Append "".
4. If *shadow*'s [delegates focus](#) is set, then append " shadowrootdelegatesfocus="".
5. If *shadow*'s [serializable](#)<sup>p117</sup> is set, then append " shadowrootserializable="".
6. If *shadow*'s [clonable](#) is set, then append " shadowrootclonable="".
7. Append ">".
8. Append the value of running the [HTML fragment serialization algorithm](#)<sup>p1368</sup> with *shadow*, *serializableShadowRoots*, and *shadowRoots* (thus recursing into this algorithm for that element).
9. Append "</template>".

5. For each child node of *the node*, in [tree order](#), run the following steps:

1. Let *current node* be the child node being processed.
2. Append the appropriate string from the following list to *s*:

↪ **If *current node* is an [Element](#)**

If *current node* is an element in the [HTML namespace](#), the [MathML namespace](#), or the [SVG namespace](#), then let *tagname* be *current node*'s local name. Otherwise, let *tagname* be *current node*'s qualified name.

Append a U+003C LESS-THAN SIGN character (<), followed by *tagname*.

**Note**

For [HTML elements](#)<sup>p45</sup> created by the [HTML parser](#)<sup>p1271</sup> or [createElement\(\)](#), *tagname* will be lowercase.

If *current node*'s [is value](#) is not null, and the element does not have an [is](#)<sup>p759</sup> attribute in its attribute list, then append the string " is=", followed by *current node*'s [is value escaped as described below](#)<sup>p1373</sup> in *attribute mode*, followed by a U+0022 QUOTATION MARK character (").

For each attribute that the element has, append a U+0020 SPACE character, the [attribute's serialized name as described below](#)<sup>p1369</sup>, a U+003D EQUALS SIGN character (=), a U+0022 QUOTATION MARK character ("), the attribute's value, [escaped as described below](#)<sup>p1373</sup> in *attribute mode*, and a second U+0022 QUOTATION MARK character (").

An **attribute's serialized name** for the purposes of the previous paragraph must be determined as follows:

↪ **If the attribute has no namespace**

The attribute's serialized name is the attribute's local name.

**Note**

For attributes on [HTML elements](#)<sup>p45</sup> set by the [HTML parser](#)<sup>p1271</sup> or by `setAttribute()`, the local name will be lowercase.

↪ **If the attribute is in the XML namespace**

The attribute's serialized name is the string "xml:" followed by the attribute's local name.

↪ **If the attribute is in the XMLNS namespace and the attribute's local name is xmlns**

The attribute's serialized name is the string "xmlns".

↪ **If the attribute is in the XMLNS namespace and the attribute's local name is not xmlns**

The attribute's serialized name is the string "xmlns:" followed by the attribute's local name.

↪ **If the attribute is in the XLink namespace**

The attribute's serialized name is the string "xlink:" followed by the attribute's local name.

↪ **If the attribute is in some other namespace**

The attribute's serialized name is the attribute's qualified name.

While the exact order of attributes is [implementation-defined](#), and may depend on factors such as the order that the attributes were given in the original markup, the sort order must be stable, such that consecutive invocations of this algorithm serialize an element's attributes in the same order.

Append a U+003E GREATER-THAN SIGN character (>).

If *current node* [serializes as void](#)<sup>p1368</sup>, then [continue](#) on to the next child node at this point.

Append the value of running the [HTML fragment serialization algorithm](#)<sup>p1368</sup> with *current node*, *serializableShadowRoots*, and *shadowRoots* (thus recursing into this algorithm for that node), followed by a U+003C LESS-THAN SIGN character (<), a U+002F SOLIDUS character (/), *tagname* again, and finally a U+003E GREATER-THAN SIGN character (>).

↪ **If *current node* is a Text node**

If the parent of *current node* is a [style](#)<sup>p200</sup>, [script](#)<sup>p652</sup>, [xmp](#)<sup>p1427</sup>, [iframe](#)<sup>p390</sup>, [noembed](#)<sup>p1426</sup>, [noframes](#)<sup>p1426</sup>, or [plaintext](#)<sup>p1426</sup> element, or if the parent of *current node* is a [noscript](#)<sup>p669</sup> element and [scripting is enabled](#)<sup>p1083</sup> for the node, then append the value of *current node*'s [data](#) literally.

Otherwise, append the value of *current node*'s [data](#), [escaped as described below](#)<sup>p1373</sup>.

↪ **If *current node* is a Comment**

Append "<!--" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS), followed by the value of *current node*'s [data](#), followed by the literal string "-->" (U+002D HYPHEN-MINUS, U+002D HYPHEN-MINUS, U+003E GREATER-THAN SIGN).

↪ **If *current node* is a ProcessingInstruction**

Append "<?" (U+003C LESS-THAN SIGN, U+003F QUESTION MARK), followed by the value of *current node*'s target IDL attribute, followed by a single U+0020 SPACE character, followed by the value of *current node*'s [data](#), followed by a single U+003E GREATER-THAN SIGN character (>).

↪ **If *current node* is a DocumentType**

Append "<!DOCTYPE" (U+003C LESS-THAN SIGN, U+0021 EXCLAMATION MARK, U+0044 LATIN CAPITAL LETTER D, U+004F LATIN CAPITAL LETTER O, U+0043 LATIN CAPITAL LETTER C, U+0054 LATIN CAPITAL LETTER T, U+0059 LATIN CAPITAL LETTER Y, U+0050 LATIN CAPITAL LETTER P, U+0045 LATIN CAPITAL LETTER E), followed by a space (U+0020 SPACE), followed by the value of *current node*'s [name](#), followed by ">" (U+003E GREATER-THAN SIGN).

6. Return *s*.

**⚠Warning!**

It is possible that the output of this algorithm, if parsed with an [HTML parser](#)<sup>p1271</sup>, will not return the original tree structure. Tree structures that do not roundtrip a serialize and reparse step can also be produced by the [HTML parser](#)<sup>p1271</sup> itself, although such cases are typically non-conforming.

### Example

For instance, if a [textarea](#)<sup>p579</sup> element to which a Comment node has been appended is serialized and the output is then reparsed, the comment will end up being displayed in the text control. Similarly, if, as a result of DOM manipulation, an element contains a comment that contains "-->", then when the result of serializing the element is parsed, the comment will be truncated at that point and the rest of the comment will be interpreted as markup. More examples would be making a [script](#)<sup>p652</sup> element contain a [Text](#) node with the text string "</script>", or having a [p](#)<sup>p229</sup> element that contains a [ul](#)<sup>p239</sup> element (as the [ul](#)<sup>p239</sup> element's [start tag](#)<sup>p1261</sup> would imply the end tag for the [p](#)<sup>p229</sup>).

This can enable cross-site scripting attacks. An example of this would be a page that lets the user enter some font family names that are then inserted into a CSS [style](#)<sup>p290</sup> block via the DOM and which then uses the [innerHTML](#)<sup>p1158</sup> IDL attribute to get the HTML serialization of that [style](#)<sup>p290</sup> element: if the user enters "</style><script>attack</script>" as a font family name, [innerHTML](#)<sup>p1158</sup> will return markup that, if parsed in a different context, would contain a [script](#)<sup>p652</sup> node, even though no [script](#)<sup>p652</sup> node existed in the original DOM.

### Example

For example, consider the following markup:

```
<form id="outer"><div></form><form id="inner"><input>
```

This will be parsed into:

```
L htmlp172
  L headp173
  L bodyp205
    L formp514 idp154="outer"
      L divp256
        L formp514 idp154="inner"
          L inputp520
```

The [input](#)<sup>p520</sup> element will be associated with the inner [form](#)<sup>p514</sup> element. Now, if this tree structure is serialized and reparsed, the `<form id="inner">` start tag will be ignored, and so the [input](#)<sup>p520</sup> element will be associated with the outer [form](#)<sup>p514</sup> element instead.

```
<html><head></head><body><form id="outer"><div><form
id="inner"><input></form></div></form></body></html>
```

```
L htmlp172
  L headp173
  L bodyp205
    L formp514 idp154="outer"
      L divp256
        L inputp520
```

### Example

As another example, consider the following markup:

```
<a><table><a>
```

This will be parsed into:

```
L htmlp172
  L headp173
  L bodyp205
    L ap257
      L ap257
        L tablep478
```

That is, the [a](#)<sup>p257</sup> elements are nested, because the second [a](#)<sup>p257</sup> element is [foster parented](#)<sup>p1319</sup>. After a serialize-reparse roundtrip, the [a](#)<sup>p257</sup> elements and the [table](#)<sup>p478</sup> element would all be siblings, because the second `<a>` start tag implicitly closes the first [a](#)<sup>p257</sup>.

element.

```
<html><head></head><body><a><a></a><table></table></a></body></html>
```

For historical reasons, this algorithm does not round-trip an initial U+000A LINE FEED (LF) character in [pre](#)<sup>p233</sup>, [textarea](#)<sup>p579</sup>, or [listing](#)<sup>p1426</sup> elements, even though (in the first two cases) the markup being round-tripped can be conforming. The [HTML parser](#)<sup>p1271</sup> will drop such a character during parsing, but this algorithm does *not* serialize an extra U+000A LINE FEED (LF) character.

#### Example

For example, consider the following markup:

```
<pre>

Hello.</pre>
```

When this document is first parsed, the [pre](#)<sup>p233</sup> element's [child text content](#) starts with a single newline character. After a serialize-reparse roundtrip, the [pre](#)<sup>p233</sup> element's [child text content](#) is simply "Hello.".

Because of the special role of the [is](#)<sup>p759</sup> attribute in signaling the creation of [customized built-in elements](#)<sup>p759</sup>, in that it provides a mechanism for parsed HTML to set the element's [is value](#), we special-case its handling during serialization. This ensures that an element's [is value](#) is preserved through serialize-parse roundtrips.

#### Example

When creating a [customized built-in element](#)<sup>p759</sup> via the parser, a developer uses the [is](#)<sup>p759</sup> attribute directly; in such cases serialize-parse roundtrips work fine.

```
<script>
window.SuperP = class extends HTMLParagraphElement {};
customElements.define("super-p", SuperP, { extends: "p" });
</script>

<div id="container"><p is="super-p">Superb!</p></div>

<script>
console.log(container.innerHTML); // <p is="super-p">
container.innerHTML = container.innerHTML;
console.log(container.innerHTML); // <p is="super-p">
console.assert(container.firstChild instanceof SuperP);
</script>
```

But when creating a customized built-in element via its [constructor](#)<sup>p759</sup> or via [createElement\(\)](#), the [is](#)<sup>p759</sup> attribute is not added. Instead, the [is value](#) (which is what the custom elements machinery uses) is set without intermediating through an attribute.

```
<script>
container.innerHTML = "";
const p = document.createElement("p", { is: "super-p" });
container.appendChild(p);

// The is attribute is not present in the DOM:
console.assert(!p.hasAttribute("is"));
```

```
// But the element is still a super-p:
console.assert(p instanceof SuperP);
</script>
```

To ensure that serialize-parse roundtrips still work, the serialization process explicitly writes out the element's `is` value as an `is`<sup>p759</sup> attribute:

```
<script>
console.log(container.innerHTML); // <p is="super-p">
container.innerHTML = container.innerHTML;
console.log(container.innerHTML); // <p is="super-p">
console.assert(container.firstChild instanceof SuperP);
</script>
```

**Escaping a string** (for the purposes of the algorithm above) consists of running the following steps:

1. Replace any occurrence of the "&" character by the string "&amp;";.
2. Replace any occurrences of the U+00A0 NO-BREAK SPACE character by the string "&nbsp;";.
3. If the algorithm was invoked in the *attribute mode*, replace any occurrences of the "\"" character by the string "&quot;";.
4. If the algorithm was *not* invoked in the *attribute mode*, replace any occurrences of the "<" character by the string "&lt;";, and any occurrences of the ">" character by the string "&gt;";.

## 13.4 Parsing HTML fragments §<sup>p13</sup><sub>73</sub>

The following steps form the **HTML fragment parsing algorithm**. The algorithm takes as input an `Element` node, referred to as the **context** element, which gives the context for the parser, *input*, a string to parse, and an optional boolean *allowDeclarativeShadowRoots* (default false). It returns a list of zero or more nodes.

### Note

*Parts marked **fragment case** in algorithms in the parser section are parts that only occur if the parser was created for the purposes of this algorithm. The algorithms have been annotated with such markings for informational purposes only; such markings have no normative weight. If it is possible for a condition described as a **fragment case**<sup>p1373</sup> to occur even when the parser wasn't created for the purposes of handling this algorithm, then that is an error in the specification.*

1. Create a new `Document`<sup>p130</sup> node, and mark it as being an `HTML document`.
2. If the `node document` of the `context`<sup>p1373</sup> element is in `quirks mode`, then let the `Document`<sup>p130</sup> be in `quirks mode`. Otherwise, if the `node document` of the `context`<sup>p1373</sup> element is in `limited-quirks mode`, then let the `Document`<sup>p130</sup> be in `limited-quirks mode`. Otherwise, leave the `Document`<sup>p130</sup> in `no-quirks mode`.
3. If *allowDeclarativeShadowRoots* is true, then set the `Document`<sup>p130</sup>'s `allow declarative shadow roots` to true.
4. Create a new `HTML parser`<sup>p1271</sup>, and associate it with the just created `Document`<sup>p130</sup> node.
5. Set the state of the `HTML parser`<sup>p1271</sup>'s `tokenization`<sup>p1290</sup> stage as follows, switching on the `context`<sup>p1373</sup> element:

↪ `title`<sup>p174</sup>

↪ `textarea`<sup>p579</sup>

Switch the tokenizer to the `RCDATA state`<sup>p1291</sup>.

- ↪ [style](#)<sup>p200</sup>
- ↪ [xmp](#)<sup>p1427</sup>
- ↪ [iframe](#)<sup>p390</sup>
- ↪ [noembed](#)<sup>p1426</sup>
- ↪ [noframes](#)<sup>p1426</sup>

Switch the tokenizer to the [RAWTEXT state](#)<sup>p1291</sup>.

- ↪ [script](#)<sup>p652</sup>

Switch the tokenizer to the [script data state](#)<sup>p1291</sup>.

- ↪ [noscript](#)<sup>p669</sup>

If the [scripting flag](#)<sup>p1289</sup> is enabled, switch the tokenizer to the [RAWTEXT state](#)<sup>p1291</sup>. Otherwise, leave the tokenizer in the [data state](#)<sup>p1291</sup>.

- ↪ [plaintext](#)<sup>p1426</sup>

Switch the tokenizer to the [PLAINTEXT state](#)<sup>p1292</sup>.

- ↪ **Any other element**

Leave the tokenizer in the [data state](#)<sup>p1291</sup>.

#### Note

*For performance reasons, an implementation that does not report errors and that uses the actual state machine described in this specification directly could use the PLAINTEXT state instead of the RAWTEXT and script data states where those are mentioned in the list above. Except for rules regarding parse errors, they are equivalent, since there is no [appropriate end tag token](#)<sup>p1290</sup> in the fragment case, yet they involve far fewer state transitions.*

6. Let *root* be a new [html](#)<sup>p172</sup> element with no attributes.
7. Append the element *root* to the [Document](#)<sup>p130</sup> node created above.
8. Set up the parser's [stack of open elements](#)<sup>p1286</sup> so that it contains just the single element *root*.
9. If the [context](#)<sup>p1373</sup> element is a [template](#)<sup>p671</sup> element, push "[in template](#)<sup>p1352</sup>" onto the [stack of template insertion modes](#)<sup>p1285</sup> so that it is the new [current template insertion mode](#)<sup>p1285</sup>.
10. Create a start tag token whose name is the local name of [context](#)<sup>p1373</sup> and whose attributes are the attributes of [context](#)<sup>p1373</sup>.  
Let this start tag token be the start tag token of the [context](#)<sup>p1373</sup> node, e.g. for the purposes of determining if it is an [HTML integration point](#)<sup>p1319</sup>.
11. [Reset the parser's insertion mode appropriately](#)<sup>p1285</sup>.

#### Note

*The parser will reference the [context](#)<sup>p1373</sup> element as part of that algorithm.*

12. Set the parser's [form element pointer](#)<sup>p1289</sup> to the nearest node to the [context](#)<sup>p1373</sup> element that is a [form](#)<sup>p514</sup> element (going straight up the ancestor chain, and including the element itself, if it is a [form](#)<sup>p514</sup> element), if any. (If there is no such [form](#)<sup>p514</sup> element, the [form element pointer](#)<sup>p1289</sup> keeps its initial value, null.)
13. Place the *input* into the [input stream](#)<sup>p1284</sup> for the [HTML parser](#)<sup>p1271</sup> just created. The encoding [confidence](#)<sup>p1278</sup> is *irrelevant*.
14. Start the parser and let it run until it has consumed all the characters just inserted into the input stream.
15. Return the child nodes of *root*, in [tree order](#).

## 13.5 Named character references <sup>§ p13</sup> <sup>74</sup>

This table lists the [character reference](#)<sup>p1269</sup> names that are supported by HTML, and the code points to which they refer. It is referenced by the previous sections.

#### Note

*It is intentional, for legacy compatibility, that many code points have multiple character reference names. For example, some*

appear both with and without the trailing semicolon, or with different capitalizations.

This data is also available [as a JSON file](#).

The glyphs displayed above are non-normative. Refer to Unicode for formal definitions of the characters listed above.

**Note**  
The character reference names originate from XML Entity Definitions for Characters, though only the above is considered normative. [\[XMLENTITY\] p1484](#)

**Note**  
This list is static and will not be expanded or changed in the future.

## 14 The XML syntax §<sup>p13</sup> 84

### Note

This section only describes the rules for XML resources. Rules for [text/html<sup>p1444</sup>](#) resources are discussed in the section above entitled "[The HTML syntax<sup>p1259</sup>](#)".

### Warning!

**Using the XML syntax is not recommended, for reasons which include the fact that there is no specification which defines the rules for how an XML parser must map a string of bytes or characters into a [Document<sup>p130</sup>](#) object, as well as the fact that the XML syntax is essentially unmaintained — in that, it's not expected that any further features will ever be added to the XML syntax (even when such features have been added to the [HTML syntax<sup>p1259</sup>](#)).**

## 14.1 Writing documents in the XML syntax §<sup>p13</sup> 84

### Note

The XML syntax for HTML was formerly referred to as "XHTML", but this specification does not use that term (among other reasons, because no such term is used for the HTML syntaxes of MathML and SVG).

The syntax for XML is defined in *XML* and *Namespaces in XML*. [\[XML\]<sup>p1484</sup>](#) [\[XMLNS\]<sup>p1484</sup>](#)

This specification does not define any syntax-level requirements beyond those defined for XML proper.

XML documents may contain a DOCTYPE if desired, but this is not required to conform to this specification. This specification does not define a public or system identifier, nor provide a formal DTD.

### Note

According to XML, XML processors are not guaranteed to process the external DTD subset referenced in the DOCTYPE. This means, for example, that using [entity references](#) for characters in XML documents is unsafe if they are defined in an external file (except for &lt;;, &gt;;, &amp;;, &quot;;, and &apos;;).

## 14.2 Parsing XML documents §<sup>p13</sup> 84

This section describes the relationship between XML and the DOM, with a particular emphasis on how this interacts with HTML.

An **XML parser**, for the purposes of this specification, is a construct that follows the rules given in *XML* to map a string of bytes or characters into a [Document<sup>p130</sup>](#) object.

### Note

At the time of writing, no such rules actually exist.

An [XML parser<sup>p1384</sup>](#) is either associated with a [Document<sup>p130</sup>](#) object when it is created, or creates one implicitly.

This [Document<sup>p130</sup>](#) must then be populated with DOM nodes that represent the tree structure of the input passed to the parser, as defined by *XML*, *Namespaces in XML*, and *DOM*. When creating DOM nodes representing elements, the [create an element for a token<sup>p1320</sup>](#) algorithm or some equivalent that operates on appropriate XML data structures must be used, to ensure the proper [element interfaces](#) are created and that [custom elements<sup>p759</sup>](#) are set up correctly.

For the operations that the [XML parser<sup>p1384</sup>](#) performs on the [Document<sup>p130</sup>](#)'s tree, the user agent must act as if elements and attributes were individually appended and set respectively so as to trigger rules in this specification regarding what happens when an element is inserted into a document or has its attributes set, and *DOM*'s requirements regarding [mutation observers](#) mean that mutation

observers are fired. [\[XML\]](#)<sup>p1484</sup> [\[XMLNS\]](#)<sup>p1484</sup> [\[DOM\]](#)<sup>p1478</sup> [\[UIEVENTS\]](#)<sup>p1483</sup>

Between the time an element's start tag is parsed and the time either the element's end tag is parsed or the parser detects a well-formedness error, the user agent must act as if the element was in a [stack of open elements](#)<sup>p1286</sup>.

#### Note

*This is used by various elements to only start certain processes once they are popped off of the [stack of open elements](#)<sup>p1286</sup>.*

This specification provides the following additional information that user agents should use when retrieving an external entity: the public identifiers given in the following list all correspond to [the URL given by this link](#). (This URL is a DTD containing the [entity declarations](#) for the names listed in the [named character references](#)<sup>p1374</sup> section.) [\[XML\]](#)<sup>p1484</sup>

- `--W3C//DTD XHTML 1.0 Transitional//EN`
- `--W3C//DTD XHTML 1.1//EN`
- `--W3C//DTD XHTML 1.0 Strict//EN`
- `--W3C//DTD XHTML 1.0 Frameset//EN`
- `--W3C//DTD XHTML Basic 1.0//EN`
- `--W3C//DTD XHTML 1.1 plus MathML 2.0//EN`
- `--W3C//DTD XHTML 1.1 plus MathML 2.0 plus SVG 1.1//EN`
- `--W3C//DTD MathML 2.0//EN`
- `--WAPFORUM//DTD XHTML Mobile 1.0//EN`

Furthermore, user agents should attempt to retrieve the above external entity's content when one of the above public identifiers is used, and should not attempt to retrieve any other external entity's content.

#### Note

*This is not strictly a [violation](#)<sup>p28</sup> of XML, but it does contradict the spirit of XML's requirements. This is motivated by a desire for user agents to all handle entities in an interoperable fashion without requiring any network access for handling external subsets. [\[XML\]](#)<sup>p1484</sup>*

XML parsers can be invoked with **XML scripting support enabled** or **XML scripting support disabled**. Except where otherwise specified, XML parsers are invoked with [XML scripting support enabled](#)<sup>p1385</sup>.

When an [XML parser](#)<sup>p1384</sup> with [XML scripting support enabled](#)<sup>p1385</sup> creates a [script](#)<sup>p652</sup> element, it must have its [parser document](#)<sup>p659</sup> set and its [force async](#)<sup>p659</sup> set to false. If the parser was created as part of the [XML fragment parsing algorithm](#)<sup>p1387</sup>, then the element's [already started](#)<sup>p659</sup> must be set to true. When the element's end tag is subsequently parsed, the user agent must [perform a microtask checkpoint](#)<sup>p1131</sup>, and then [prepare](#)<sup>p661</sup> the [script](#)<sup>p652</sup> element. If this causes there to be a [pending parsing-blocking script](#)<sup>p665</sup>, then the user agent must run the following steps:

1. Block this instance of the [XML parser](#)<sup>p1384</sup>, such that the [event loop](#)<sup>p1123</sup> will not run [tasks](#)<sup>p1124</sup> that invoke it.
2. [Spin the event loop](#)<sup>p1131</sup> until the parser's [Document](#)<sup>p130</sup> [has no style sheet that is blocking scripts](#)<sup>p204</sup> and the [pending parsing-blocking script](#)<sup>p665</sup>'s [ready to be parser-executed](#)<sup>p659</sup> is true.
3. Unblock this instance of the [XML parser](#)<sup>p1384</sup>, such that [tasks](#)<sup>p1124</sup> that invoke it can again be run.
4. [Execute the script element](#)<sup>p665</sup> given by the [pending parsing-blocking script](#)<sup>p665</sup>.
5. Set the [pending parsing-blocking script](#)<sup>p665</sup> to null.

#### Note

*Since the [document.write\(\)](#)<sup>p1153</sup> API is not available for [XML documents](#), much of the complexity in the [HTML parser](#)<sup>p1271</sup> is not needed in the [XML parser](#)<sup>p1384</sup>.*

#### Note

*When the [XML parser](#)<sup>p1384</sup> has [XML scripting support disabled](#)<sup>p1385</sup>, none of this happens.*

When an [XML parser](#)<sup>p1384</sup> would append a node to a [template](#)<sup>p671</sup> element, it must instead append it to the [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup> (a [DocumentFragment](#) node).

#### Note

*This is a [willful violation](#)<sup>p28</sup> of XML; unfortunately, XML is not formally extensible in the manner that is needed for [template](#)<sup>p671</sup> processing. [\[XML\]](#)<sup>p1484</sup>*

When an [XML parser](#)<sup>p1384</sup> creates a [Node](#) object, its [node document](#) must be set to the [node document](#) of the node into which the newly created node is to be inserted.

Certain algorithms in this specification **spoon-feed the parser** characters one string at a time. In such cases, the [XML parser](#)<sup>p1384</sup> must act as it would have if faced with a single string consisting of the concatenation of all those characters.

When an [XML parser](#)<sup>p1384</sup> reaches the end of its input, it must [stop parsing](#)<sup>p1358</sup>, following the same rules as the [HTML parser](#)<sup>p1271</sup>. An [XML parser](#)<sup>p1384</sup> can also be [aborted](#)<sup>p1359</sup>, which must again be done in the same way as for an [HTML parser](#)<sup>p1271</sup>.

For the purposes of conformance checkers, if a resource is determined to be in [the XML syntax](#)<sup>p1384</sup>, then it is an [XML document](#).

## 14.3 Serializing XML fragments <sup>p13</sup><sub>86</sub>

The **XML fragment serialization algorithm** for a [Document](#)<sup>p130</sup> or [Element](#) node either returns a fragment of XML that represents that node or throws an exception.

For [Document](#)<sup>p130</sup>s, the algorithm must return a string in the form of a [document entity](#), if none of the error cases below apply.

For [Elements](#), the algorithm must return a string in the form of an [internal general parsed entity](#), if none of the error cases below apply.

In both cases, the string returned must be XML namespace-well-formed and must be an isomorphic serialization of all of that node's [relevant child nodes](#)<sup>p1386</sup>, in [tree order](#). User agents may adjust prefixes and namespace declarations in the serialization (and indeed might be forced to do so in some cases to obtain namespace-well-formed XML). User agents may use a combination of regular text and character references to represent [Text](#) nodes in the DOM.

A node's **relevant child nodes** are those that apply given the following rules:

### For [template](#)<sup>p671</sup> elements

The [relevant child nodes](#)<sup>p1386</sup> are the child nodes of the [template](#)<sup>p671</sup> element's [template contents](#)<sup>p673</sup>, if any.

### For all other nodes

The [relevant child nodes](#)<sup>p1386</sup> are the child nodes of node itself, if any.

For [Elements](#), if any of the elements in the serialization are in no namespace, the default namespace in scope for those elements must be explicitly declared as the empty string. (This doesn't apply in the [Document](#)<sup>p130</sup> case.) [\[XML\]](#)<sup>p1484</sup> [\[XMLNS\]](#)<sup>p1484</sup>

For the purposes of this section, an internal general parsed entity is considered XML namespace-well-formed if a document consisting of an element with no namespace declarations whose contents are the internal general parsed entity would itself be XML namespace-well-formed.

If any of the following error cases are found in the DOM subtree being serialized, then the algorithm must throw an ["InvalidStateError" DOMException](#) instead of returning a string:

- A [Document](#)<sup>p130</sup> node with no child element nodes.
- A [DocumentType](#) node that has an external subset public identifier that contains characters that are not matched by the XML PubidChar production. [\[XML\]](#)<sup>p1484</sup>
- A [DocumentType](#) node that has an external subset system identifier that contains both a U+0022 QUOTATION MARK (") and a U+0027 APOSTROPHE (') or that contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1484</sup>
- A node with a local name containing a U+003A COLON (:).
- A node with a local name that does not match the XML [Name](#) production. [\[XML\]](#)<sup>p1484</sup>
- An [Attr](#) node with no namespace whose local name is the lowercase string "xmlns". [\[XMLNS\]](#)<sup>p1484</sup>
- An [Element](#) node with two or more attributes with the same local name and namespace.
- An [Attr](#) node, [Text](#) node, [Comment](#) node, or [ProcessingInstruction](#) node whose data contains characters that are not matched by the XML Char production. [\[XML\]](#)<sup>p1484</sup>
- A [Comment](#) node whose data contains two adjacent U+002D HYPHEN-MINUS characters (-) or ends with such a character.

- A [ProcessingInstruction](#) node whose target name is an [ASCII case-insensitive](#) match for the string "xml".
- A [ProcessingInstruction](#) node whose target name contains a U+003A COLON (:).
- A [ProcessingInstruction](#) node whose data contains the string ">".

#### Note

*These are the only ways to make a DOM unserialisable. The DOM enforces all the other XML constraints; for example, trying to append two elements to a [Document](#)<sup>p130</sup> node will throw a [HierarchyRequestError](#) DOMException.*

## 14.4 Parsing XML fragments §<sup>p13</sup> 87

The **XML fragment parsing algorithm** either returns a [Document](#)<sup>p130</sup> or throws a ["SyntaxError"](#) DOMException. Given a string *input* and a context element [context](#)<sup>p1373</sup>, the algorithm is as follows:

1. Create a new [XML parser](#)<sup>p1384</sup>.
2. [Feed the parser](#)<sup>p1386</sup> just created the string corresponding to the start tag of the [context](#)<sup>p1373</sup> element, declaring all the namespace prefixes that are in scope on that element in the DOM, as well as declaring the default namespace (if any) that is in scope on that element in the DOM.

A namespace prefix is in scope if the DOM `lookupNamespaceURI()` method on the element would return a non-null value for that prefix.

The default namespace is the namespace for which the DOM `isDefaultNamespace()` method on the element would return true.

#### Note

*No DOCTYPE is passed to the parser, and therefore no external subset is referenced, and therefore no entities will be recognized.*

3. [Feed the parser](#)<sup>p1386</sup> just created the string *input*.
4. [Feed the parser](#)<sup>p1386</sup> just created the string corresponding to the end tag of the [context](#)<sup>p1373</sup> element.
5. If there is an XML well-formedness or XML namespace well-formedness error, then throw a ["SyntaxError"](#) DOMException.
6. If the [document element](#) of the resulting [Document](#)<sup>p130</sup> has any sibling nodes, then throw a ["SyntaxError"](#) DOMException.
7. Return the child nodes of the [document element](#) of the resulting [Document](#)<sup>p130</sup>, in [tree order](#).

## 15 Rendering §<sup>p13</sup> 88

User agents are not required to present HTML documents in any particular way. However, this section provides a set of suggestions for rendering HTML documents that, if followed, are likely to lead to a user experience that closely resembles the experience intended by the documents' authors. So as to avoid confusion regarding the normativity of this section, "must" has not been used. Instead, the term "expected" is used to indicate behavior that will lead to this experience. For the purposes of conformance for user agents designated as [supporting the suggested default rendering](#)<sup>p48</sup>, the term "expected" in this section has the same conformance implications as "must".

### 15.1 Introduction §<sup>p13</sup> 88

The suggestions in this section are generally expressed in CSS terms. User agents are expected to either support CSS, or translate from the CSS rules given in this section to approximations for other presentation mechanisms.

In the absence of style-layer rules to the contrary (e.g. author style sheets), user agents are expected to render an element so that it conveys to the user the meaning that the element [represents](#)<sup>p141</sup>, as described by this specification.

The suggestions in this section generally assume a visual output medium with a resolution of 96dpi or greater, but HTML is intended to apply to multiple media (it is a *media-independent* language). User agent implementers are encouraged to adapt the suggestions in this section to their target media.

An element is **being rendered** if it has any associated CSS layout boxes, SVG layout boxes, or some equivalent in other styling languages.

#### Note

Just being off-screen does not mean the element is not [being rendered](#)<sup>p1388</sup>. The presence of the [hidden](#)<sup>p824</sup> attribute normally means the element is not [being rendered](#)<sup>p1388</sup>, though this might be overridden by the style sheets.

#### Note

The [fully active](#)<sup>p1003</sup> state does not affect whether an element is [being rendered](#)<sup>p1388</sup> or not. Even if a document is not [fully active](#)<sup>p1003</sup> and not shown at all to the user, elements within it can still qualify as "being rendered".

An element is said to **intersect the viewport** when it is [being rendered](#)<sup>p1388</sup> and its associated CSS layout box intersects the [viewport](#).

#### Note

Similar to the [being rendered](#)<sup>p1388</sup> state, elements in non-[fully active](#)<sup>p1003</sup> documents can still [intersect the viewport](#)<sup>p1388</sup>. The [viewport](#) is not shared between documents and might not always be shown to the user, so an element in a non-[fully active](#)<sup>p1003</sup> document can still intersect the [viewport](#) associated with its document.

#### Note

This specification does not define the precise timing for when the intersection is tested, but it is suggested that the timing match that of the [Intersection Observer API](#). [\[INTERSECTIONOBSERVER\]](#)<sup>p1479</sup>

An element is **delegating its rendering to its children** if it is not [being rendered](#)<sup>p1388</sup> but its children (if any) could [be rendered](#)<sup>p1388</sup>, as a result of CSS 'display: contents', or some equivalent in other styling languages. [\[CSSDISPLAY\]](#)<sup>p1476</sup>

User agents that do not honor author-level CSS style sheets are nonetheless expected to act as if they applied the CSS rules given in these sections in a manner consistent with this specification and the relevant CSS and Unicode specifications. [\[CSS\]](#)<sup>p1476</sup>  
[\[UNICODE\]](#)<sup>p1483</sup> [\[BIDI\]](#)<sup>p1475</sup>

## Note

This is especially important for issues relating to the '[display](#)', '[unicode-bidi](#)', and '[direction](#)' properties.

## 15.2 The CSS user agent style sheet and presentational hints § p13

89

The CSS rules given in these subsections are, except where otherwise specified, expected to be used as part of the user-agent level style sheet defaults for all documents that contain [HTML elements](#)<sup>p45</sup>.

Some rules are intended for the author-level zero-specificity presentational hints part of the CSS cascade; these are explicitly called out as **presentational hints**.

When the text below says that an attribute *attribute* on an element *element* **maps to the pixel length property** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p77</sup> doesn't generate an error, then the user agent is expected to use the parsed value as a pixel length for a [presentational hint](#)<sup>p1389</sup> for *properties*.

When the text below says that an attribute *attribute* on an element *element* **maps to the dimension property** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing dimension values](#)<sup>p79</sup> doesn't generate an error, then the user agent is expected to use the parsed dimension as the value for a [presentational hint](#)<sup>p1389</sup> for *properties*, with the value given as a pixel length if the dimension was a length, and with the value given as a percentage if the dimension was a percentage.

When the text below says that an attribute *attribute* on an element *element* **maps to the dimension property (ignoring zero)** (or properties) *properties*, it means that if *element* has an attribute *attribute* set, and parsing that attribute's value using the [rules for parsing nonzero dimension values](#)<sup>p80</sup> doesn't generate an error, then the user agent is expected to use the parsed dimension as the value for a [presentational hint](#)<sup>p1389</sup> for *properties*, with the value given as a pixel length if the dimension was a length, and with the value given as a percentage if the dimension was a percentage.

When the text below says that a pair of attributes *w* and *h* on an element *element* **map to the aspect-ratio property**, it means that if *element* has both attributes *w* and *h*, and parsing those attributes' values using the [rules for parsing non-negative integers](#)<sup>p77</sup> doesn't generate an error for either, then the user agent is expected to use the parsed integers as a [presentational hint](#)<sup>p1389</sup> for the '[aspect-ratio](#)' property of the form `auto w / h`.

When the text below says that a pair of attributes *w* and *h* on an element *element* **map to the aspect-ratio property (using dimension rules)**, it means that if *element* has both attributes *w* and *h*, and parsing those attributes' values using the [rules for parsing dimension values](#)<sup>p79</sup> doesn't generate an error or return a percentage for either, then the user agent is expected to use the parsed dimensions as a [presentational hint](#)<sup>p1389</sup> for the '[aspect-ratio](#)' property of the form `auto w / h`.

When a user agent is to **align descendants** of a node, the user agent is expected to align only those descendants that have both their '[margin-inline-start](#)' and '[margin-inline-end](#)' properties computing to a value other than 'auto', that are over-constrained and that have one of those two margins with a [used value](#) forced to a greater value, and that do not themselves have an applicable [align](#) attribute. When multiple elements are to [align](#)<sup>p1389</sup> a particular descendant, the most deeply nested such element is expected to override the others. Aligned elements are expected to be aligned by having the [used values](#) of their margins on the [line-left](#) and [line-right](#) sides be set accordingly. [\[CSSLOGICAL\]](#)<sup>p1477</sup> [\[CSSWM\]](#)<sup>p1477</sup>

## 15.3 Non-replaced elements § p13

89

### 15.3.1 Hidden elements § p13

89

```
CSS @namespace "http://www.w3.org/1999/xhtml";

area, base, basefont, datalist, head, link, meta, noembed,
noframes, param, rp, script, style, template, title {
  display: none;
}
```

```

[hidden]:not([hidden=until-found i]):not(embed) {
  display: none;
}

[hidden=until-found i]:not(embed) {
  content-visibility: hidden;
}

embed[hidden] { display: inline; height: 0; width: 0; }

input[type=hidden i] { display: none !important; }

@media (scripting) {
  noscript { display: none !important; }
}

```

### 15.3.2 The page <sup>§<sup>p13</sup></sup><sub>90</sub>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

html, body { display: block; }

```

For each property in the table below, given a [body<sup>p205</sup>](#) element, the first attribute that exists [maps to the pixel length property<sup>p1389</sup>](#) on the [body<sup>p205</sup>](#) element. If none of the attributes for a property are found, or if the value of the attribute that was found cannot be parsed successfully, then a default value of 8px is expected to be used for that property instead.

Property	Source
'margin-top'	The <a href="#">body<sup>p205</sup></a> element's <a href="#">marginheight<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">topmargin<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">container frame element<sup>p1390</sup></a> 's <a href="#">marginheight<sup>p1430</sup></a> attribute
'margin-right'	The <a href="#">body<sup>p205</sup></a> element's <a href="#">marginwidth<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">rightmargin<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">container frame element<sup>p1390</sup></a> 's <a href="#">marginwidth<sup>p1430</sup></a> attribute
'margin-bottom'	The <a href="#">body<sup>p205</sup></a> element's <a href="#">marginheight<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">bottommargin<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">container frame element<sup>p1390</sup></a> 's <a href="#">marginheight<sup>p1430</sup></a> attribute
'margin-left'	The <a href="#">body<sup>p205</sup></a> element's <a href="#">marginwidth<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">leftmargin<sup>p1430</sup></a> attribute
	The <a href="#">body<sup>p205</sup></a> element's <a href="#">container frame element<sup>p1390</sup></a> 's <a href="#">marginwidth<sup>p1430</sup></a> attribute

If the [body<sup>p205</sup>](#) element's [node document](#)'s [node navigable<sup>p989</sup>](#) is a [child navigable<sup>p992</sup>](#), and the [container<sup>p991</sup>](#) of that [navigable<sup>p989</sup>](#) is a [frame<sup>p1433</sup>](#) or [iframe<sup>p390</sup>](#) element, then the **container frame element** of the [body<sup>p205</sup>](#) element is that [frame<sup>p1433</sup>](#) or [iframe<sup>p390</sup>](#) element. Otherwise, there is no [container frame element<sup>p1390</sup>](#).

#### ⚠Warning!

*The above requirements imply that a page can change the margins of another page (including one from another [origin<sup>p898</sup>](#)) using, for example, an [iframe<sup>p390</sup>](#). This is potentially a security risk, as it might in some cases allow an attack to contrive a situation in which a page is rendered not as the author intended, possibly for the purposes of phishing or otherwise misleading the user.*

If a [Document<sup>p130</sup>](#)'s [node navigable<sup>p989</sup>](#) is a [child navigable<sup>p992</sup>](#), then it is expected to be positioned and sized to fit inside the [content box](#) of the [container<sup>p991</sup>](#) of that [navigable<sup>p989</sup>](#). If the [container<sup>p991</sup>](#) is not [being rendered<sup>p1388</sup>](#), the [navigable<sup>p989</sup>](#) is expected to have a [viewport](#) with zero width and zero height.

If a [Document<sup>p130</sup>](#)'s [node navigable<sup>p989</sup>](#) is a [child navigable<sup>p992</sup>](#), the [container<sup>p991</sup>](#) of that [navigable<sup>p989</sup>](#) is a [frame<sup>p1433</sup>](#) or [iframe<sup>p390</sup>](#) element, that element has a [scrolling](#) attribute, and that attribute's value is an [ASCII case-insensitive](#) match for the string "off",

"noscroll", or "no", then the user agent is expected to prevent any scrollbars from being shown for the [viewport](#) of the [Document](#)<sup>p130</sup>'s [node navigable](#)<sup>p989</sup>, regardless of the 'overflow' property that applies to that [viewport](#).

When a [body](#)<sup>p205</sup> element has a [background](#)<sup>p1431</sup> attribute set to a non-empty value, the new value is expected to be [encoding-parsed-and-serialized](#)<sup>p97</sup> relative to the element's [node document](#), and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's 'background-image' property to the return value.

When a [body](#)<sup>p205</sup> element has a [bgcolor](#)<sup>p1430</sup> attribute set, the new value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's 'background-color' property to the resulting color.

When a [body](#)<sup>p205</sup> element has a [text](#)<sup>p1430</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's 'color' property to the resulting color.

When a [body](#)<sup>p205</sup> element has a [link](#)<sup>p1430</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the 'color' property of any element in the [Document](#)<sup>p130</sup> matching the [:link](#)<sup>p783</sup> [pseudo-class](#) to the resulting color.

When a [body](#)<sup>p205</sup> element has a [vlink](#)<sup>p1430</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the 'color' property of any element in the [Document](#)<sup>p130</sup> matching the [:visited](#)<sup>p783</sup> [pseudo-class](#) to the resulting color.

When a [body](#)<sup>p205</sup> element has an [alink](#)<sup>p1430</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the 'color' property of any element in the [Document](#)<sup>p130</sup> matching the [:active](#)<sup>p783</sup> [pseudo-class](#) and either the [:link](#)<sup>p783</sup> [pseudo-class](#) or the [:visited](#)<sup>p783</sup> [pseudo-class](#) to the resulting color.

### 15.3.3 Flow content <sup>§p13</sup> <sup>91</sup>

```
CSS @namespace "http://www.w3.org/1999/xhtml";

address, blockquote, center, dialog, div, figure, figcaption, footer, form,
header, hr, legend, listing, main, p, plaintext, pre, search, xmp {
  display: block;
}

blockquote, figure, listing, p, plaintext, pre, xmp {
  margin-block: 1em;
}

blockquote, figure { margin-inline: 40px; }

address { font-style: italic; }
listing, plaintext, pre, xmp {
  font-family: monospace; white-space: pre;
}

dialog:not([open]) { display: none; }
dialog {
  position: absolute;
  inset-inline-start: 0; inset-inline-end: 0;
  width: fit-content;
  height: fit-content;
  margin: auto;
  border: solid;
  padding: 1em;
  background-color: Canvas;
  color: CanvasText;
}
```

```

}
dialog:modal {
  position: fixed;
  overflow: auto;
  inset-block: 0;
  max-width: calc(100% - 6px - 2em);
  max-height: calc(100% - 6px - 2em);
}
dialog::backdrop {
  background: rgba(0,0,0,0.1);
}

[popover]:not(:popover-open):not(dialog[open]) {
  display:none;
}

dialog:popover-open {
  display:block;
}

[popover] {
  position: fixed;
  inset: 0;
  width: fit-content;
  height: fit-content;
  margin: auto;
  border: solid;
  padding: 0.25em;
  overflow: auto;
  color: CanvasText;
  background-color: Canvas;
}

:popover-open::backdrop {
  position: fixed;
  inset: 0;
  pointer-events: none !important;
  background-color: transparent;
}

slot {
  display: contents;
}

```

The following rules are also expected to apply, as [presentational hints](#)<sup>p1389</sup>:

```

CSS @namespace "http://www.w3.org/1999/xhtml";

pre[wrap] { white-space: pre-wrap; }

```

In [quirks mode](#), the following rules are also expected to apply:

```

CSS @namespace "http://www.w3.org/1999/xhtml";

form { margin-block-end: 1em; }

```

The [center](#)<sup>p1427</sup> element, and the [div](#)<sup>p256</sup> element when it has an [align](#)<sup>p1438</sup> attribute whose value is an [ASCII case-insensitive](#) match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their ['text-align'](#) property set to 'center' in a [presentational hint](#)<sup>p1389</sup>, and to [align descendants](#)<sup>p1389</sup> to the center.

The [div<sup>p256</sup>](#) element, when it has an [align<sup>p1430</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "left", is expected to left-align text within itself, as if it had its ['text-align'](#) property set to 'left' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the left.

The [div<sup>p256</sup>](#) element, when it has an [align<sup>p1430</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "right", is expected to right-align text within itself, as if it had its ['text-align'](#) property set to 'right' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the right.

The [div<sup>p256</sup>](#) element, when it has an [align<sup>p1430</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "justify", is expected to full-justify text within itself, as if it had its ['text-align'](#) property set to 'justify' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the left.

### 15.3.4 Phrasing content §<sup>p13</sup> 93

```
CSS @namespace "http://www.w3.org/1999/xhtml";

cite, dfn, em, i, var { font-style: italic; }
b, strong { font-weight: bolder; }
code, kbd, samp, tt { font-family: monospace; }
big { font-size: larger; }
small { font-size: smaller; }

sub { vertical-align: sub; }
sup { vertical-align: super; }
sub, sup { line-height: normal; font-size: smaller; }

ruby { display: ruby; }
rt { display: ruby-text; }

:link { color: #0000EE; }
:visited { color: #551A8B; }
:link:active, :visited:active { color: #FF0000; }
:link, :visited { text-decoration: underline; cursor: pointer; }

:focus-visible { outline: auto; }

mark { background: yellow; color: black; } /* this color is just a suggestion and can be changed based
on implementation feedback */

abbr[title], acronym[title] { text-decoration: dotted underline; }
ins, u { text-decoration: underline; }
del, s, strike { text-decoration: line-through; }

q::before { content: open-quote; }
q::after { content: close-quote; }

br { display-outside: newline; } /* this also has bidi implications */
nobr { white-space: nowrap; }
wbr { display-outside: break-opportunity; } /* this also has bidi implications */
nobr wbr { white-space: normal; }
```

The following rules are also expected to apply, as [presentational hints<sup>p1389</sup>](#):

```
CSS @namespace "http://www.w3.org/1999/xhtml";

br[clear=left i] { clear: left; }
br[clear=right i] { clear: right; }
br[clear=all i], br[clear=both i] { clear: both; }
```

For the purposes of the CSS ruby model, runs of children of [ruby<sup>p270</sup>](#) elements that are not [rt<sup>p277</sup>](#) or [rp<sup>p277</sup>](#) elements are expected to be

wrapped in anonymous boxes whose `'display'` property has the value `'ruby-base'`. [CSSRUBY]<sup>p1477</sup>

When a particular part of a ruby has more than one annotation, the annotations should be distributed on both sides of the base text so as to minimize the stacking of ruby annotations on one side.

**Note**  
*When it becomes possible to do so, the preceding requirement will be updated to be expressed in terms of CSS ruby. (Currently, CSS ruby does not handle nested `ruby`<sup>p276</sup> elements or multiple sequential `rt`<sup>p277</sup> elements, which is how this semantic is expressed.)*

User agents that do not support correct ruby rendering are expected to render parentheses around the text of `rt`<sup>p277</sup> elements in the absence of `rp`<sup>p277</sup> elements.

User agents are expected to support the `'clear'` property on inline elements (in order to render `br`<sup>p299</sup> elements with `clear`<sup>p1430</sup> attributes) in the manner described in the non-normative note to this effect in CSS.

The initial value for the `'color'` property is expected to be black. The initial value for the `'background-color'` property is expected to be 'transparent'. The canvas's background is expected to be white.

When a `font`<sup>p1427</sup> element has a `color` attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'color'` property to the resulting color.

When a `font`<sup>p1427</sup> element has a `face` attribute, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'font-family'` property to the attribute's value.

When a `font`<sup>p1427</sup> element has a `size` attribute, the user agent is expected to use the following steps, known as the **rules for parsing a legacy font size**, to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'font-size'` property:

1. Let *input* be the attribute's value.
2. Let *position* be a pointer into *input*, initially pointing at the start of the string.
3. [Skip ASCII whitespace](#) within *input* given *position*.
4. If *position* is past the end of *input*, there is no [presentational hint](#)<sup>p1389</sup>. Return.
5. If the character at *position* is a U+002B PLUS SIGN character (+), then let *mode* be *relative-plus*, and advance *position* to the next character. Otherwise, if the character at *position* is a U+002D HYPHEN-MINUS character (-), then let *mode* be *relative-minus*, and advance *position* to the next character. Otherwise, let *mode* be *absolute*.
6. [Collect a sequence of code points](#) that are [ASCII digits](#) from *input* given *position*, and let the resulting sequence be *digits*.
7. If *digits* is the empty string, there is no [presentational hint](#)<sup>p1389</sup>. Return.
8. Interpret *digits* as a base-ten integer. Let *value* be the resulting number.
9. If *mode* is *relative-plus*, then increment *value* by 3. If *mode* is *relative-minus*, then let *value* be the result of subtracting *value* from 3.
10. If *value* is greater than 7, let it be 7.
11. If *value* is less than 1, let it be 1.
12. Set `'font-size'` to the keyword corresponding to the value of *value* according to the following table:

value	'font-size' keyword
1	'x-small'
2	'small'
3	'medium'
4	'large'
5	'x-large'
6	'xx-large'

value	'font-size' keyword
7	'xxx-large'

### 15.3.5 Bidirectional text <sup>§ p13</sup> <sub>95</sub>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

[dir]:dir(ltr), bdi:dir(ltr), input[type=tel i]:dir(ltr) { direction: ltr; }
[dir]:dir rtl, bdi:dir rtl { direction: rtl; }

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, search, table, caption, colgroup, col,
thead, tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, bdi, output,
[dir=ltr i], [dir=rtl i], [dir=auto i] {
  unicode-bidi: isolate;
}

bdo, bdo[dir] { unicode-bidi: isolate-override; }

input[dir=auto i]:is([type=search i], [type=tel i], [type=url i],
[type=email i]), textarea[dir=auto i], pre[dir=auto i] {
  unicode-bidi: plaintext;
}
/* see prose for input elements whose type attribute is in the Text state */

/* the rules setting the 'content' property on br and wbr elements also has bidi implications */

```

When an [input](#)<sup>p520</sup> element's [dir](#)<sup>p160</sup> attribute is in the [auto](#)<sup>p160</sup> state and its [type](#)<sup>p523</sup> attribute is in the [Text](#)<sup>p527</sup> state, then the user agent is expected to act as if it had a user-agent-level style sheet rule setting the '[unicode-bidi](#)' property to 'plaintext'.

Input fields (i.e. [textarea](#)<sup>p579</sup> elements, and [input](#)<sup>p520</sup> elements when their [type](#)<sup>p523</sup> attribute is in the [Text](#)<sup>p527</sup>, [Search](#)<sup>p527</sup>, [Telephone](#)<sup>p528</sup>, [URL](#)<sup>p529</sup>, or [Email](#)<sup>p530</sup> state) are expected to present an editing user interface with a directionality that matches the element's '[direction](#)' property.

When the document's character encoding is [ISO-8859-8](#), the following rules are additionally expected to apply, following those above: [\[ENCODING\]](#)<sup>p1478</sup>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

address, blockquote, center, div, figure, figcaption, footer, form, header, hr,
legend, listing, main, p, plaintext, pre, summary, xmp, article, aside, h1, h2,
h3, h4, h5, h6, hgroup, nav, section, search, table, caption, colgroup, col,
thead, tbody, tfoot, tr, td, th, dir, dd, dl, dt, menu, ol, ul, li, [dir=ltr i],
[dir=rtl i], [dir=auto i], *|* {
  unicode-bidi: bidi-override;
}

input:not([type=submit i]):not([type=reset i]):not([type=button i]),
textarea {
  unicode-bidi: normal;
}

```

### 15.3.6 Sections and headings <sup>§ p13</sup> <sub>95</sub>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

article, aside, h1, h2, h3, h4, h5, h6, hgroup, nav, section {

```

```

    display: block;
}

h1 { margin-block: 0.67em; font-size: 2.00em; font-weight: bold; }
h2 { margin-block: 0.83em; font-size: 1.50em; font-weight: bold; }
h3 { margin-block: 1.00em; font-size: 1.17em; font-weight: bold; }
h4 { margin-block: 1.33em; font-size: 1.00em; font-weight: bold; }
h5 { margin-block: 1.67em; font-size: 0.83em; font-weight: bold; }
h6 { margin-block: 2.33em; font-size: 0.67em; font-weight: bold; }

```

In the following CSS block, x is shorthand for the following selector: `:is(article, aside, nav, section)`

```

CSS @namespace "http://www.w3.org/1999/xhtml";

x h1 { margin-block: 0.83em; font-size: 1.50em; }
x x h1 { margin-block: 1.00em; font-size: 1.17em; }
x x x h1 { margin-block: 1.33em; font-size: 1.00em; }
x x x x h1 { margin-block: 1.67em; font-size: 0.83em; }
x x x x x h1 { margin-block: 2.33em; font-size: 0.67em; }

```

#### Note

*The shorthand is used to keep this block at least mildly readable.*

### 15.3.7 Lists <sup>p13</sup><sub>96</sub>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

dir, dd, dl, dt, menu, ol, ul { display: block; }
li { display: list-item; text-align: match-parent; }

dir, dl, menu, ol, ul { margin-block: 1em; }

:is(dir, dl, menu, ol, ul) :is(dir, dl, menu, ol, ul) {
    margin-block: 0;
}

dd { margin-inline-start: 40px; }
dir, menu, ol, ul { padding-inline-start: 40px; }

ol, ul, menu { counter-reset: list-item; }
ol { list-style-type: decimal; }

dir, menu, ul {
    list-style-type: disc;
}

:is(dir, menu, ol, ul) :is(dir, menu, ul) {
    list-style-type: circle;
}

:is(dir, menu, ol, ul) :is(dir, menu, ol, ul) :is(dir, menu, ul) {
    list-style-type: square;
}

```

The following rules are also expected to apply, as [presentational hints](#) <sup>p1389</sup>:

```

CSS @namespace "http://www.w3.org/1999/xhtml";

ol[type="1"], li[type="1"] { list-style-type: decimal; }

```

```

ol[type=a s], li[type=a s] { list-style-type: lower-alpha; }
ol[type=A s], li[type=A s] { list-style-type: upper-alpha; }
ol[type=i s], li[type=i s] { list-style-type: lower-roman; }
ol[type=I s], li[type=I s] { list-style-type: upper-roman; }
ul[type=none i], li[type=none i] { list-style-type: none; }
ul[type=disc i], li[type=disc i] { list-style-type: disc; }
ul[type=circle i], li[type=circle i] { list-style-type: circle; }
ul[type=square i], li[type=square i] { list-style-type: square; }

```

When rendering [li](#) <sup>p241</sup> elements, non-CSS user agents are expected to use the [ordinal value](#) <sup>p242</sup> of the [li](#) <sup>p241</sup> element to render the counter in the list item marker.

For CSS user agents, some aspects of rendering [list items](#) are defined by the *CSS Lists* specification. Additionally, the following attribute mappings are expected to apply: [\[CSSLISTS\]](#) <sup>p1477</sup>

When an [li](#) <sup>p241</sup> element has a [value](#) <sup>p242</sup> attribute, and parsing that attribute's value using the [rules for parsing integers](#) <sup>p76</sup> doesn't generate an error, the user agent is expected to use the parsed value *value* as a [presentational hint](#) <sup>p1389</sup> for the 'counter-set' property of the form `list-item value`.

When an [ol](#) <sup>p238</sup> element has a [start](#) <sup>p238</sup> attribute or a [reversed](#) <sup>p238</sup> attribute, or both, the user agent is expected to use the following steps to treat the attributes as a [presentational hint](#) <sup>p1389</sup> for the 'counter-reset' property:

1. Let *value* be null.
2. If the element has a [start](#) <sup>p238</sup> attribute, then set *value* to the result of parsing the attribute's value using the [rules for parsing integers](#) <sup>p76</sup>.
3. If the element has a [reversed](#) <sup>p238</sup> attribute, then:
  1. If *value* is an integer, then increment *value* by 1 and return `reversed(list-item) value`.
  2. Otherwise, return `reversed(list-item)`.

#### Note

*Either the [start](#) <sup>p238</sup> attribute was absent, or parsing its value resulted in an error.*

4. Otherwise:
  1. If *value* is an integer, then decrement *value* by 1 and return `list-item value`.
  2. Otherwise, there is no [presentational hint](#) <sup>p1389</sup>.

## 15.3.8 Tables <sup>§ p13</sup> <sup>97</sup>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

table { display: table; }
caption { display: table-caption; }
colgroup, colgroup[hidden] { display: table-column-group; }
col, col[hidden] { display: table-column; }
thead, thead[hidden] { display: table-header-group; }
tbody, tbody[hidden] { display: table-row-group; }
tfoot, tfoot[hidden] { display: table-footer-group; }
tr, tr[hidden] { display: table-row; }
td, th { display: table-cell; }

colgroup[hidden], col[hidden], thead[hidden], tbody[hidden],
tfoot[hidden], tr[hidden] {
  visibility: collapse;
}

```

```

table {
  box-sizing: border-box;
  border-spacing: 2px;
  border-collapse: separate;
  text-indent: initial;
}
td, th { padding: 1px; }
th { font-weight: bold; }

caption { text-align: center; }
thead, tbody, tfoot, table > tr { vertical-align: middle; }
tr, td, th { vertical-align: inherit; }

thead, tbody, tfoot, tr { border-color: inherit; }
table[rules=none i], table[rules=groups i], table[rules=rows i],
table[rules=cols i], table[rules=all i], table[frame=void i],
table[frame=above i], table[frame=below i], table[frame=hsides i],
table[frame=lhs i], table[frame=rhs i], table[frame=vsides i],
table[frame=box i], table[frame=border i],
table[rules=none i] > tr > td, table[rules=none i] > tr > th,
table[rules=groups i] > tr > td, table[rules=groups i] > tr > th,
table[rules=rows i] > tr > td, table[rules=rows i] > tr > th,
table[rules=cols i] > tr > td, table[rules=cols i] > tr > th,
table[rules=all i] > tr > td, table[rules=all i] > tr > th,
table[rules=none i] > thead > tr > td, table[rules=none i] > thead > tr > th,

  border-block-style: solid;
}

table[rules=rows i] > tr, table[rules=rows i] > thead > tr,
table[rules=rows i] > tbody > tr, table[rules=rows i] > tfoot > tr {
  border-block-width: 1px;
  border-block-style: solid;
}

```

In [quirks mode](#), the following rules are also expected to apply:

**CSS** `@namespace "http://www.w3.org/1999/xhtml";`

```

table {
  font-weight: initial;
  font-style: initial;
  font-variant: initial;
  font-size: initial;
  line-height: initial;
  white-space: initial;
  text-align: initial;
}

```

For the purposes of the CSS table model, the `col`<sup>p488</sup> element is expected to be treated as if it was present as many times as its `span`<sup>p488</sup> attribute [specifies](#)<sup>p77</sup>.

For the purposes of the CSS table model, the `colgroup`<sup>p487</sup> element, if it contains no `col`<sup>p488</sup> element, is expected to be treated as if it had as many such children as its `span`<sup>p488</sup> attribute [specifies](#)<sup>p77</sup>.

For the purposes of the CSS table model, the `colspan`<sup>p496</sup> and `rowspan`<sup>p497</sup> attributes on `td`<sup>p493</sup> and `th`<sup>p495</sup> elements are expected to [provide](#)<sup>p77</sup> the *special knowledge* regarding cells spanning rows and columns.

In [HTML documents](#), the following rules are also expected to apply:

```
CSS @namespace "http://www.w3.org/1999/xhtml";

:is(table, thead, tbody, tfoot, tr) > form { display: none !important; }
```

The [table<sup>p478</sup>](#) element's [cellspacing<sup>p1431</sup>](#) attribute [maps to the pixel length property<sup>p1389</sup>](#) ['border-spacing'](#) on the element.

The [table<sup>p478</sup>](#) element's [cellpadding<sup>p1431</sup>](#) attribute [maps to the pixel length properties<sup>p1389</sup>](#) ['padding-top'](#), ['padding-right'](#), ['padding-bottom'](#), and ['padding-left'](#) of any [td<sup>p493</sup>](#) and [th<sup>p495</sup>](#) elements that have corresponding [cells<sup>p497</sup>](#) in the [table<sup>p497</sup>](#) corresponding to the [table<sup>p478</sup>](#) element.

The [table<sup>p478</sup>](#) element's [height<sup>p1431</sup>](#) attribute [maps to the dimension property<sup>p1389</sup>](#) ['height'](#) on the [table<sup>p478</sup>](#) element.

The [table<sup>p478</sup>](#) element's [width<sup>p1431</sup>](#) attribute [maps to the dimension property \(ignoring zero\)<sup>p1389</sup>](#) ['width'](#) on the [table<sup>p478</sup>](#) element.

The [col<sup>p488</sup>](#) element's [width<sup>p1430</sup>](#) attribute [maps to the dimension property<sup>p1389</sup>](#) ['width'](#) on the [col<sup>p488</sup>](#) element.

The [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), and [tfoot<sup>p491</sup>](#) elements' [height<sup>p1431</sup>](#) attribute [maps to the dimension property<sup>p1389</sup>](#) ['height'](#) on the element.

The [tr<sup>p492</sup>](#) element's [height<sup>p1431</sup>](#) attribute [maps to the dimension property<sup>p1389</sup>](#) ['height'](#) on the [tr<sup>p492</sup>](#) element.

The [td<sup>p493</sup>](#) and [th<sup>p495</sup>](#) elements' [height<sup>p1431</sup>](#) attributes [map to the dimension property \(ignoring zero\)<sup>p1389</sup>](#) ['height'](#) on the element.

The [td<sup>p493</sup>](#) and [th<sup>p495</sup>](#) elements' [width<sup>p1431</sup>](#) attributes [map to the dimension property \(ignoring zero\)<sup>p1389</sup>](#) ['width'](#) on the element.

The [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), and [th<sup>p495</sup>](#) elements, when they have an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for either the string "center" or the string "middle", are expected to center text within themselves, as if they had their ['text-align'](#) property set to 'center' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the center.

The [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), and [th<sup>p495</sup>](#) elements, when they have an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "left", are expected to left-align text within themselves, as if they had their ['text-align'](#) property set to 'left' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the left.

The [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), and [th<sup>p495</sup>](#) elements, when they have an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "right", are expected to right-align text within themselves, as if they had their ['text-align'](#) property set to 'right' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the right.

The [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), and [th<sup>p495</sup>](#) elements, when they have an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "justify", are expected to full-justify text within themselves, as if they had their ['text-align'](#) property set to 'justify' in a [presentational hint<sup>p1389</sup>](#), and to [align descendants<sup>p1389</sup>](#) to the left.

User agents are expected to have a rule in their user agent style sheet that matches [th<sup>p495</sup>](#) elements that have a parent node whose [computed value](#) for the ['text-align'](#) property is its initial value, whose declaration block consists of just a single declaration that sets the ['text-align'](#) property to the value 'center'.

When a [table<sup>p478</sup>](#), [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), or [th<sup>p495</sup>](#) element has a [background<sup>p1431</sup>](#) attribute set to a non-empty value, the new value is expected to be [encoding-parsed-and-serialized<sup>p97</sup>](#) relative to the element's [node document](#), and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint<sup>p1389</sup>](#) setting the element's ['background-image'](#) property to the return value.

When a [table<sup>p478</sup>](#), [thead<sup>p490</sup>](#), [tbody<sup>p489</sup>](#), [tfoot<sup>p491</sup>](#), [tr<sup>p492</sup>](#), [td<sup>p493</sup>](#), or [th<sup>p495</sup>](#) element has a [bgcolor](#) attribute set, the new value is expected to be parsed using the [rules for parsing a legacy color value<sup>p94</sup>](#), and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint<sup>p1389</sup>](#) setting the element's ['background-color'](#) property to the resulting color.

When a [table<sup>p478</sup>](#) element has a [bordercolor<sup>p1431</sup>](#) attribute, its value is expected to be parsed using the [rules for parsing a legacy color value<sup>p94</sup>](#), and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint<sup>p1389</sup>](#) setting the element's ['border-top-color'](#), ['border-right-color'](#), ['border-bottom-color'](#), and ['border-left-color'](#) properties to the resulting color.

The [table<sup>p478</sup>](#) element's [border<sup>p1431</sup>](#) attribute [maps to the pixel length properties<sup>p1389</sup>](#) ['border-top-width'](#), ['border-right-width'](#), ['border-bottom-width'](#), ['border-left-width'](#) on the element. If the attribute is present but parsing the attribute's value using the [rules for parsing](#)

[non-negative integers](#)<sup>p77</sup> generates an error, a default value of 1px is expected to be used for that property instead.

Rules marked "**only if border is not equivalent to zero**" in the CSS block above is expected to only be applied if the [border](#)<sup>p1431</sup> attribute mentioned in the selectors for the rule is not only present but, when parsed using the [rules for parsing non-negative integers](#)<sup>p77</sup>, is also found to have a value other than zero or to generate an error.

In [quirks mode](#), a [td](#)<sup>p493</sup> element or a [th](#)<sup>p495</sup> element that has a [nowrap](#)<sup>p1431</sup> attribute but also has a [width](#)<sup>p1431</sup> attribute whose value, when parsed using the [rules for parsing nonzero dimension values](#)<sup>p80</sup>, is found to be a length (not an error or a number classified as a percentage), is expected to have a [presentational hint](#)<sup>p1389</sup> setting the element's '[white-space](#)' property to 'normal', overriding the rule in the CSS block above that sets it to 'nowrap'.

### 15.3.9 Margin collapsing quirks <sup>§ p1402</sup>

A node is **substantial** if it is a text node that is not [inter-element whitespace](#)<sup>p147</sup>, or if it is an element node.

A node is **blank** if it is an element that contains no [substantial](#)<sup>p1402</sup> nodes.

The **elements with default margins** are the following elements: [blockquote](#)<sup>p235</sup>, [dir](#)<sup>p1426</sup>, [dl](#)<sup>p244</sup>, [h1](#)<sup>p216</sup>, [h2](#)<sup>p216</sup>, [h3](#)<sup>p216</sup>, [h4](#)<sup>p216</sup>, [h5](#)<sup>p216</sup>, [h6](#)<sup>p216</sup>, [listing](#)<sup>p1426</sup>, [menu](#)<sup>p240</sup>, [ol](#)<sup>p238</sup>, [p](#)<sup>p229</sup>, [plaintext](#)<sup>p1426</sup>, [pre](#)<sup>p233</sup>, [ul](#)<sup>p239</sup>, [xmp](#)<sup>p1427</sup>

In [quirks mode](#), any [element with default margins](#)<sup>p1402</sup> that is the [child](#) of a [body](#)<sup>p205</sup>, [td](#)<sup>p493</sup>, or [th](#)<sup>p495</sup> element and has no [substantial](#)<sup>p1402</sup> previous siblings is expected to have a user-agent level style sheet rule that sets its '[margin-block-start](#)' property to zero.

In [quirks mode](#), any [element with default margins](#)<sup>p1402</sup> that is the [child](#) of a [body](#)<sup>p205</sup>, [td](#)<sup>p493</sup>, or [th](#)<sup>p495</sup> element, has no [substantial](#)<sup>p1402</sup> previous siblings, and is [blank](#)<sup>p1402</sup>, is expected to have a user-agent level style sheet rule that sets its '[margin-block-end](#)' property to zero also.

In [quirks mode](#), any [element with default margins](#)<sup>p1402</sup> that is the [child](#) of a [td](#)<sup>p493</sup> or [th](#)<sup>p495</sup> element, has no [substantial](#)<sup>p1402</sup> following siblings, and is [blank](#)<sup>p1402</sup>, is expected to have a user-agent level style sheet rule that sets its '[margin-block-start](#)' property to zero.

In [quirks mode](#), any [p](#)<sup>p229</sup> element that is the [child](#) of a [td](#)<sup>p493</sup> or [th](#)<sup>p495</sup> element and has no [substantial](#)<sup>p1402</sup> following siblings, is expected to have a user-agent level style sheet rule that sets its '[margin-block-end](#)' property to zero.

### 15.3.10 Form controls <sup>§ p1402</sup>

```
css @namespace "http://www.w3.org/1999/xhtml";
```

```
input, select, button, textarea {
  letter-spacing: initial;
  word-spacing: initial;
  line-height: initial;
  text-transform: initial;
  text-indent: initial;
  text-shadow: initial;
  appearance: auto;
}

input:not([type=image i], [type=range i], [type=checkbox i], [type=radio i]) {
  overflow: clip !important;
  overflow-clip-margin: 0 !important;
}

input, select, textarea {
  text-align: initial;
}
```

```

:autofill {
  field-sizing: fixed !important;
}

input:is([type=reset i], [type=button i], [type=submit i]), button {
  text-align: center;
}

input, button {
  display: inline-block;
}

input[type=hidden i], input[type=file i], input[type=image i] {
  appearance: none;
}

input:is([type=radio i], [type=checkbox i], [type=reset i], [type=button i],
[type=submit i], [type=checkbox i], [type=search i]), select, button {
  box-sizing: border-box;
}

textarea { white-space: pre-wrap; }

```

In [quirks mode](#), the following rules are also expected to apply:

```

CSS @namespace "http://www.w3.org/1999/xhtml";

input:not([type=image i]), textarea { box-sizing: border-box; }

```

Each kind of form control is also described in the [Widgets](#)<sup>p1410</sup> section, which describes the look and feel of the control.

For [input](#)<sup>p529</sup> elements where the [type](#)<sup>p523</sup> attribute is not in the [Hidden](#)<sup>p527</sup> state or the [Image Button](#)<sup>p547</sup> state, and that are [being rendered](#)<sup>p1388</sup>, are expected to act as follows:

- The [inner display type](#) is always 'flow-root'.

### 15.3.11 The [hr](#)<sup>p231</sup> element <sup>§<sup>p14</sup><sub>03</sub></sup>

```

CSS @namespace "http://www.w3.org/1999/xhtml";

hr {
  color: gray;
  border-style: inset;
  border-width: 1px;
  margin-block: 0.5em;
  margin-inline: auto;
  overflow: hidden;
}

```

The following rules are also expected to apply, as [presentational hints](#)<sup>p1389</sup>:

```

CSS @namespace "http://www.w3.org/1999/xhtml";

hr[align=left i] { margin-left: 0; margin-right: auto; }
hr[align=right i] { margin-left: auto; margin-right: 0; }
hr[align=center i] { margin-left: auto; margin-right: auto; }
hr[color], hr[noshade] { border-style: solid; }

```

If an [hr](#)<sup>p231</sup> element has either a [color](#)<sup>p1439</sup> attribute or a [noshade](#)<sup>p1439</sup> attribute, and furthermore also has a [size](#)<sup>p1439</sup> attribute, and

parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p77</sup> doesn't generate an error, then the user agent is expected to use the parsed value divided by two as a pixel length for [presentational hints](#)<sup>p1389</sup> for the properties `'border-top-width'`, `'border-right-width'`, `'border-bottom-width'`, and `'border-left-width'` on the element.

Otherwise, if an `hr`<sup>p231</sup> element has neither a `color`<sup>p1430</sup> attribute nor a `noshade`<sup>p1430</sup> attribute, but does have a `size`<sup>p1430</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p77</sup> doesn't generate an error, then: if the parsed value is one, then the user agent is expected to use the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'border-bottom-width'` to 0; otherwise, if the parsed value is greater than one, then the user agent is expected to use the parsed value minus two as a pixel length for [presentational hints](#)<sup>p1389</sup> for the `'height'` property on the element.

The `width`<sup>p1430</sup> attribute on an `hr`<sup>p231</sup> element [maps to the dimension property](#)<sup>p1389</sup> `'width'` on the element.

When an `hr`<sup>p231</sup> element has a `color`<sup>p1430</sup> attribute, its value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'color'` property to the resulting color.

### 15.3.12 The `fieldset`<sup>p594</sup> and `legend`<sup>p596</sup> elements §<sup>p14</sup> 04

```
CSS @namespace "http://www.w3.org/1999/xhtml";

fieldset {
  display: block;
  margin-inline: 2px;
  border: groove 2px ThreeDFace;
  padding-block: 0.35em 0.625em;
  padding-inline: 0.75em;
  min-inline-size: min-content;
}

legend {
  padding-inline: 2px;
}

legend[align=left i] {
  justify-self: left;
}

legend[align=center i] {
  justify-self: center;
}

legend[align=right i] {
  justify-self: right;
}
```

The `fieldset`<sup>p594</sup> element, when it generates a [CSS box](#), is expected to act as follows:

- The element is expected to establish a new [block formatting context](#).
- The `'display'` property is expected to act as follows:
  - If the computed value of `'display'` is a value such that the [outer display type](#) is 'inline', then behave as 'inline-block'.
  - Otherwise, behave as 'flow-root'.

#### Note

*This does not change the computed value.*

- If the element's box has a child box that matches the conditions in the list below, then the first such child box is the 'fieldset' element's **rendered legend**:

- The child is a [legend<sup>p596</sup>](#) element.
  - The child's used value of ['float'](#) is 'none'.
  - The child's used value of ['position'](#) is not 'absolute' or 'fixed'.
- If the element has a [rendered legend<sup>p1404</sup>](#), then the border is expected to not be painted behind the rectangle defined as follows, using the writing mode of the fieldset:
  1. The block-start edge of the rectangle is the smaller of the block-start edge of the [rendered legend<sup>p1404</sup>](#)'s margin rectangle at its static position (ignoring transforms), and the block-start outer edge of the [fieldset<sup>p594</sup>](#)'s border.
  2. The block-end edge of the rectangle is the larger of the block-end edge of the [rendered legend<sup>p1404</sup>](#)'s margin rectangle at its static position (ignoring transforms), and the block-end outer edge of the [fieldset<sup>p594</sup>](#)'s border.
  3. The inline-start edge of the rectangle is the smaller of the inline-start edge of the [rendered legend<sup>p1404</sup>](#)'s border rectangle at its static position (ignoring transforms), and the inline-start outer edge of the [fieldset<sup>p594</sup>](#)'s border.
  4. The inline-end edge of the rectangle is the larger of the inline-end edge of the [rendered legend<sup>p1404</sup>](#)'s border rectangle at its static position (ignoring transforms), and the inline-end outer edge of the [fieldset<sup>p594</sup>](#)'s border.
- The space allocated for the element's border on the block-start side is expected to be the element's ['border-block-start-width'](#) or the [rendered legend<sup>p1404</sup>](#)'s margin box size in the [fieldset<sup>p594</sup>](#)'s block-flow direction, whichever is greater.
- For the purpose of calculating the used ['block-size'](#), if the computed ['block-size'](#) is not 'auto', the space allocated for the [rendered legend<sup>p1404</sup>](#)'s margin box that spills out past the border, if any, is expected to be subtracted from the ['block-size'](#). If the content box's block-size would be negative, then let the content box's block-size be zero instead.
- If the element has a [rendered legend<sup>p1404</sup>](#), then that element is expected to be the first child box.
- The [anonymous fieldset content box<sup>p1405</sup>](#) is expected to appear after the [rendered legend<sup>p1404</sup>](#) and is expected to contain the content (including the [':before'](#) and [':after'](#) pseudo-elements) of the [fieldset<sup>p594</sup>](#) element except for the [rendered legend<sup>p1404</sup>](#), if there is one.
- The used value of the ['padding-top'](#), ['padding-right'](#), ['padding-bottom'](#), and ['padding-left'](#) properties are expected to be zero.
- For the purpose of calculating the min-content inline size, use the greater of the min-content inline size of the [rendered legend<sup>p1404</sup>](#) and the min-content inline size of the [anonymous fieldset content box<sup>p1405</sup>](#).
- For the purpose of calculating the max-content inline size, use the greater of the max-content inline size of the [rendered legend<sup>p1404</sup>](#) and the max-content inline size of the [anonymous fieldset content box<sup>p1405</sup>](#).

A [fieldset<sup>p594</sup>](#) element's [rendered legend<sup>p1404</sup>](#), if any, is expected to act as follows:

- The element is expected to establish a new [formatting context](#) for its contents. The type of this [formatting context](#) is determined by its ['display'](#) value, as usual.
- The ['display'](#) property is expected to behave as if its computed value was blockified.

#### Note

*This does not change the computed value.*

- If the [computed value](#) of ['inline-size'](#) is 'auto', then the [used value](#) is the [fit-content inline size](#).
- The element is expected to be positioned in the inline direction as is normal for blocks (e.g., taking into account margins and the ['justify-self'](#) property).
- The element's box is expected to be constrained in the inline direction by the inline content size of the [fieldset<sup>p594</sup>](#) as if it had used its computed inline padding.

#### Example

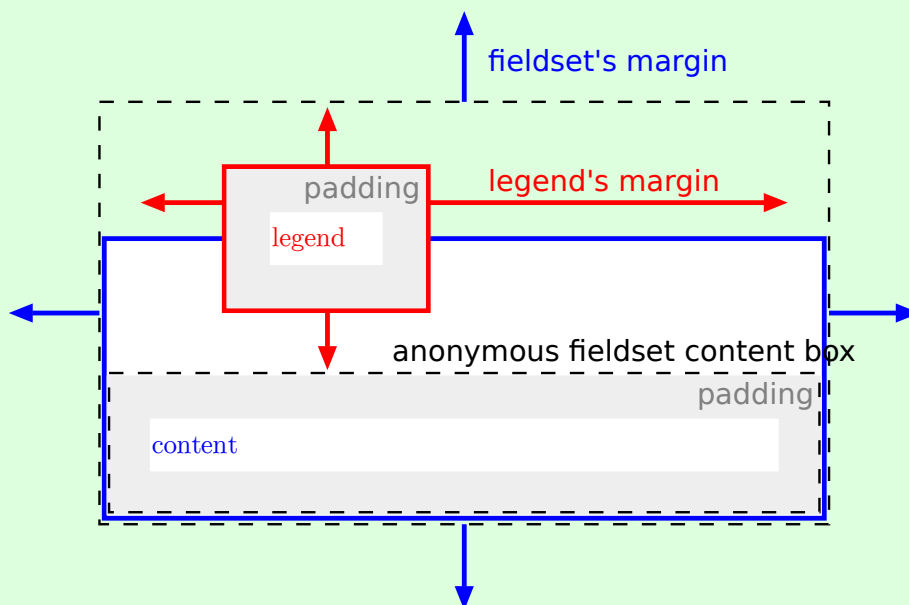

For example, if the [fieldset<sup>p594</sup>](#) has a specified padding of 50px, then the [rendered legend<sup>p1404</sup>](#) will be positioned 50px in from the [fieldset<sup>p594</sup>](#)'s border. The padding will further apply to the [anonymous fieldset content box<sup>p1405</sup>](#) instead of the [fieldset<sup>p594</sup>](#) element itself.

- The element is expected to be positioned in the block-flow direction such that its border box is centered over the border on the block-start side of the [fieldset<sup>p594</sup>](#) element.

A [fieldset<sup>p594</sup>](#) element's **anonymous fieldset content box** is expected to act as follows:

- The `'display'` property is expected to act as follows:
  - If the computed value of `'display'` on the `fieldsetp594` element is 'grid' or 'inline-grid', then set the used value to 'grid'.
  - If the computed value of `'display'` on the `fieldsetp594` element is 'flex' or 'inline-flex', then set the used value to 'flex'.
  - Otherwise, set the used value to 'flow-root'.
- The following properties are expected to inherit from the `fieldsetp594` element:
  - `'align-content'`
  - `'align-items'`
  - `'border-radius'`
  - `'column-count'`
  - `'column-fill'`
  - `'column-gap'`
  - `'column-rule'`
  - `'column-width'`
  - `'flex-direction'`
  - `'flex-wrap'`
  - `'grid-auto-columns'`
  - `'grid-auto-flow'`
  - `'grid-auto-rows'`
  - `'grid-column-gap'`
  - `'grid-row-gap'`
  - `'grid-template-areas'`
  - `'grid-template-columns'`
  - `'grid-template-rows'`
  - `'justify-content'`
  - `'justify-items'`
  - `'overflow'`
  - `'padding-bottom'`
  - `'padding-left'`
  - `'padding-right'`
  - `'padding-top'`
  - `'text-overflow'`
  - `'unicode-bidi'`
- The `'block-size'` property is expected to be set to '100%'.
- For the purpose of calculating percentage padding, act as if the padding was calculated for the `fieldsetp594` element.

#### Note

The legend is rendered over the top border, and the top border area reserves vertical space for the legend. The fieldset's top margin starts at the top margin edge of the legend. The legend's horizontal margins, or the `'justify-self'` property, gives its horizontal position. The `anonymous fieldset content boxp1405` appears below the legend.

## 15.4 Replaced elements § p14 07

### Note

The following elements can be [replaced elements](#): [audio](#)<sup>p410</sup>, [canvas](#)<sup>p677</sup>, [embed](#)<sup>p399</sup>, [iframe](#)<sup>p390</sup>, [img](#)<sup>p346</sup>, [input](#)<sup>p520</sup>, [object](#)<sup>p402</sup>, and [video](#)<sup>p406</sup>.

### 15.4.1 Embedded content § p14 07

The [embed](#)<sup>p399</sup>, [iframe](#)<sup>p390</sup>, and [video](#)<sup>p406</sup> elements are expected to be treated as [replaced elements](#).

A [canvas](#)<sup>p677</sup> element that [represents](#)<sup>p141</sup> [embedded content](#)<sup>p150</sup> is expected to be treated as a [replaced element](#); the contents of such elements are the element's bitmap, if any, or else a [transparent black](#) bitmap with the same [natural dimensions](#) as the element. Other [canvas](#)<sup>p677</sup> elements are expected to be treated as ordinary elements in the rendering model.

An [object](#)<sup>p402</sup> element that [represents](#)<sup>p141</sup> an image, plugin, or its [content navigable](#)<sup>p991</sup> is expected to be treated as a [replaced element](#). Other [object](#)<sup>p402</sup> elements are expected to be treated as ordinary elements in the rendering model.

The [audio](#)<sup>p410</sup> element, when it is [exposing a user interface](#)<sup>p464</sup>, is expected to be treated as a [replaced element](#) about one line high, as wide as is necessary to expose the user agent's user interface features. When an [audio](#)<sup>p410</sup> element is not [exposing a user interface](#)<sup>p464</sup>, the user agent is expected to force its ['display'](#) property to compute to 'none', irrespective of CSS rules.

Whether a [video](#)<sup>p406</sup> element is [exposing a user interface](#)<sup>p464</sup> is not expected to affect the size of the rendering; controls are expected to be overlaid above the page content without causing any layout changes, and are expected to disappear when the user does not need them.

When a [video](#)<sup>p406</sup> element represents a poster frame or frame of video, the poster frame or frame of video is expected to be rendered at the largest size that maintains the aspect ratio of that poster frame or frame of video without being taller or wider than the [video](#)<sup>p406</sup> element itself, and is expected to be centered in the [video](#)<sup>p406</sup> element.

Any subtitles or captions are expected to be overlaid directly on top of their [video](#)<sup>p406</sup> element, as defined by the relevant rendering rules; for WebVTT, those are the [rules for updating the display of WebVTT text tracks](#). [\[WEBVTT\]](#)<sup>p1484</sup>

When the user agent starts [exposing a user interface](#)<sup>p464</sup> for a [video](#)<sup>p406</sup> element, the user agent should run the [rules for updating the text track rendering](#)<sup>p450</sup> of each of the [text tracks](#)<sup>p449</sup> in the [video](#)<sup>p406</sup> element's [list of text tracks](#)<sup>p449</sup> that are [showing](#)<sup>p450</sup> and whose [text track kind](#)<sup>p449</sup> is one of [subtitles](#)<sup>p449</sup> or [captions](#)<sup>p449</sup> (e.g., for [text tracks](#)<sup>p449</sup> based on WebVTT, the [rules for updating the display of WebVTT text tracks](#)). [\[WEBVTT\]](#)<sup>p1484</sup>

### Note

Resizing [video](#)<sup>p406</sup> and [canvas](#)<sup>p677</sup> elements does not interrupt video playback or clear the canvas.

The following CSS rules are expected to apply:

```
CSS @namespace "http://www.w3.org/1999/xhtml";

iframe { border: 2px inset; }
video { object-fit: contain; }
```

### 15.4.2 Images § p14 07

User agents are expected to render [img](#)<sup>p346</sup> elements and [input](#)<sup>p520</sup> elements whose [type](#)<sup>p523</sup> attributes are in the [Image Button](#)<sup>p547</sup> state, according to the first applicable rules from the following list:

#### ↪ If the element [represents](#)<sup>p141</sup> an image

The user agent is expected to treat the element as a [replaced element](#) and render the image according to the rules for doing so defined in CSS.

↪ If the element does not [represent](#)<sup>p141</sup> an image and either:

- the user agent has reason to believe that the image will become [available](#)<sup>p364</sup> and be rendered in due course, or
- the element has no `alt` attribute, or
- the [Document](#)<sup>p130</sup> is in [quirks mode](#), and the element already has [natural dimensions](#) (e.g., from the [dimension attributes](#)<sup>p477</sup> or CSS rules)

The user agent is expected to treat the element as a [replaced element](#) whose content is the text that the element represents, if any, optionally alongside an icon indicating that the image is being obtained (if applicable). For [input](#)<sup>p520</sup> elements, the element is expected to appear button-like to indicate that the element is a [button](#)<sup>p514</sup>.

↪ If the element is an [img](#)<sup>p346</sup> element that [represents](#)<sup>p141</sup> some text and the user agent does not expect this to change

The user agent is expected to treat the element as a non-replaced phrasing element whose content is the text, optionally with an icon indicating that an image is missing, so that the user can request the image be displayed or investigate why it is not rendering. In non-graphical contexts, such an icon should be omitted.

↪ If the element is an [img](#)<sup>p346</sup> element that [represents](#)<sup>p141</sup> nothing and the user agent does not expect this to change

The user agent is expected to treat the element as a [replaced element](#) whose [natural dimensions](#) are 0. (In the absence of further styles, this will cause the element to essentially not be rendered.)

↪ If the element is an [input](#)<sup>p520</sup> element that does not [represent](#)<sup>p141</sup> an image and the user agent does not expect this to change

The user agent is expected to treat the element as a [replaced element](#) consisting of a button whose content is the element's alternative text. The [natural dimensions](#) of the button are expected to be about one line in height and whatever width is necessary to render the text on one line.

The icons mentioned above are expected to be relatively small so as not to disrupt most text but be easily clickable. In a visual environment, for instance, icons could be 16 pixels by 16 pixels square, or 1em by 1em if the images are scalable. In an audio environment, the icon could be a short bleep. The icons are intended to indicate to the user that they can be used to get to whatever options the UA provides for images, and, where appropriate, are expected to provide access to the context menu that would have come up if the user interacted with the actual image.

All animated images with the same [absolute URL](#) and the same image data are expected to be rendered synchronized to the same timeline as a group, with the timeline starting at the time of the least recent addition to the group.

#### Note

*In other words, when a second image with the same [absolute URL](#) and animated image data is inserted into a document, it jumps to the point in the animation cycle that is currently being displayed by the first image.*

When a user agent is to **restart the animation** for an [img](#)<sup>p346</sup> element showing an animated image, all animated images with the same [absolute URL](#) and the same image data in that [img](#)<sup>p346</sup> element's [node document](#) are expected to restart their animation from the beginning.

The following CSS rules are expected to apply:

```
CSS @namespace "http://www.w3.org/1999/xhtml";

img:is([sizes="auto" i], [sizes^="auto," i]) {
  contain: size !important;
  contain-intrinsic-size: 300px 150px;
}
```

The following CSS rules are expected to apply when the [Document](#)<sup>p130</sup> is in [quirks mode](#):

```
CSS @namespace "http://www.w3.org/1999/xhtml";

img[align=left i] { margin-right: 3px; }
img[align=right i] { margin-left: 3px; }
```

### 15.4.3 Attributes for embedded content and images §<sup>p14</sup><sub>09</sub>

The following CSS rules are expected to apply as [presentational hints](#)<sup>p1389</sup>:

```
CSS @namespace "http://www.w3.org/1999/xhtml";

iframe[frameborder='0'], iframe[frameborder=no i] { border: none; }

embed[align=left i], iframe[align=left i], img[align=left i],
input[type=image i][align=left i], object[align=left i] {
  float: left;
}

embed[align=right i], iframe[align=right i], img[align=right i],
input[type=image i][align=right i], object[align=right i] {
  float: right;
}

embed[align=top i], iframe[align=top i], img[align=top i],
input[type=image i][align=top i], object[align=top i] {
  vertical-align: top;
}

embed[align=baseline i], iframe[align=baseline i], img[align=baseline i],
input[type=image i][align=baseline i], object[align=baseline i] {
  vertical-align: baseline;
}

embed[align=texttop i], iframe[align=texttop i], img[align=texttop i],
input[type=image i][align=texttop i], object[align=texttop i] {
  vertical-align: text-top;
}

embed[align=absmiddle i], iframe[align=absmiddle i], img[align=absmiddle i],
input[type=image i][align=absmiddle i], object[align=absmiddle i],
embed[align=abscenter i], iframe[align=abscenter i], img[align=abscenter i],
input[type=image i][align=abscenter i], object[align=abscenter i] {
  vertical-align: middle;
}

embed[align=bottom i], iframe[align=bottom i], img[align=bottom i],
input[type=image i][align=bottom i], object[align=bottom i] {
  vertical-align: bottom;
}
```

When an [embed](#)<sup>p399</sup>, [iframe](#)<sup>p390</sup>, [img](#)<sup>p346</sup>, or [object](#)<sup>p402</sup> element, or an [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Image Button](#)<sup>p547</sup> state, has an [align](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "center" or the string "middle", the user agent is expected to act as if the element's '[vertical-align](#)' property was set to a value that aligns the vertical middle of the element with the parent element's baseline.

The [hspace](#) attribute of [embed](#)<sup>p399</sup>, [img](#)<sup>p346</sup>, or [object](#)<sup>p402</sup> elements, and [input](#)<sup>p520</sup> elements with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state, [maps to the dimension properties](#)<sup>p1389</sup> '[margin-left](#)' and '[margin-right](#)' on the element.

The [vspace](#) attribute of [embed](#)<sup>p399</sup>, [img](#)<sup>p346</sup>, or [object](#)<sup>p402</sup> elements, and [input](#)<sup>p520</sup> elements with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state, [maps to the dimension properties](#)<sup>p1389</sup> '[margin-top](#)' and '[margin-bottom](#)' on the element.

When an [img](#)<sup>p346</sup> element, [object](#)<sup>p402</sup> element, or [input](#)<sup>p520</sup> element with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state has a [border](#) attribute whose value, when parsed using the [rules for parsing non-negative integers](#)<sup>p77</sup>, is found to be a number greater than zero, the user agent is expected to use the parsed value for eight [presentational hints](#)<sup>p1389</sup>: four setting the parsed value as a pixel length for the element's '[border-top-width](#)', '[border-right-width](#)', '[border-bottom-width](#)', and '[border-left-width](#)' properties, and four setting the element's '[border-top-style](#)', '[border-right-style](#)', '[border-bottom-style](#)', and '[border-left-style](#)' properties to the value 'solid'.

The [width](#)<sup>p477</sup> and [height](#)<sup>p477</sup> attributes on an [img](#)<sup>p346</sup> element's [dimension attribute source](#)<sup>p347</sup> [map to the dimension properties](#)<sup>p1389</sup>

'width' and 'height' on the [img](#)<sup>p346</sup> element respectively. They similarly [map to the aspect-ratio property \(using dimension rules\)](#)<sup>p1389</sup> of the [img](#)<sup>p346</sup> element.

The [width](#)<sup>p477</sup> and [height](#)<sup>p477</sup> attributes on [embed](#)<sup>p399</sup>, [iframe](#)<sup>p390</sup>, [object](#)<sup>p402</sup>, and [video](#)<sup>p406</sup> elements, and [input](#)<sup>p520</sup> elements with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state and that either represents an image or that the user expects will eventually represent an image, [map to the dimension properties](#)<sup>p1389</sup> 'width' and 'height' on the element respectively.

The [width](#)<sup>p477</sup> and [height](#)<sup>p477</sup> attributes [map to the aspect-ratio property \(using dimension rules\)](#)<sup>p1389</sup> on [img](#)<sup>p346</sup> and [video](#)<sup>p406</sup> elements, and [input](#)<sup>p520</sup> elements with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state.

The [width](#)<sup>p678</sup> and [height](#)<sup>p678</sup> attributes [map to the aspect-ratio property](#)<sup>p1389</sup> on [canvas](#)<sup>p677</sup> elements.

#### 15.4.4 Image maps <sup>§ p14</sup><sub>10</sub>

Shapes on an [image map](#)<sup>p473</sup> are expected to act, for the purpose of the CSS cascade, as elements independent of the original [area](#)<sup>p471</sup> element that happen to match the same style rules but inherit from the [img](#)<sup>p346</sup> or [object](#)<sup>p402</sup> element.

For the purposes of the rendering, only the 'cursor' property is expected to have any effect on the shape.

##### Example

Thus, for example, if an [area](#)<sup>p471</sup> element has a [style](#)<sup>p163</sup> attribute that sets the 'cursor' property to 'help', then when the user designates that shape, the cursor would change to a Help cursor.

##### Example

Similarly, if an [area](#)<sup>p471</sup> element had a CSS rule that set its 'cursor' property to 'inherit' (or if no rule setting the 'cursor' property matched the element at all), the shape's cursor would be inherited from the [img](#)<sup>p346</sup> or [object](#)<sup>p402</sup> element of the [image map](#)<sup>p473</sup>, not from the parent of the [area](#)<sup>p471</sup> element.

### 15.5 Widgets <sup>§ p14</sup><sub>10</sub>

#### 15.5.1 Native appearance <sup>§ p14</sup><sub>10</sub>

The *CSS Basic User Interface* specification calls elements that can have a [native appearance widgets](#), and defines whether to use that [native appearance](#) depending on the 'appearance' property. That logic, in turn, depends on whether each the element is classified as a [devolvable widget](#) or [non-devolvable widget](#). This section defines which elements match these concepts for HTML, what their [native appearance](#) is, and any particularity of their [devolved](#) state or [primitive appearance](#). [\[CSSUI\]](#)<sup>p1477</sup>

The following elements can have a [native appearance](#) for the purpose of the CSS 'appearance' property.

- [button](#)<sup>p566</sup>
- [input](#)<sup>p520</sup>
- [meter](#)<sup>p589</sup>
- [progress](#)<sup>p587</sup>
- [select](#)<sup>p568</sup>
- [textarea](#)<sup>p579</sup>

#### 15.5.2 Writing mode <sup>§ p14</sup><sub>10</sub>

Several widgets have their rendering controlled by the 'writing-mode' CSS property. For the purposes of those widgets, we have the following definitions.

A **horizontal writing mode** is when resolving the 'writing-mode' property of the control results in a computed value of 'horizontal-tb'.

A **vertical writing mode** is when resolving the 'writing-mode' property of the control results in a computed value of either 'vertical-rl', 'vertical-lr', 'sideways-rl' or 'sideways-lr'.

### 15.5.3 Button layout § p14 11

When an element uses [button layout<sup>p1411</sup>](#), it is a [devolvable widget](#), and its [native appearance](#) is that of a button.

**Button layout** is as follows:

- If the element is a [button<sup>p566</sup>](#) element, then the ['display'](#) property is expected to act as follows:
  - If the computed value of ['display'](#) is 'inline-grid', 'grid', 'inline-flex', 'flex', 'none', or 'contents', then behave as the computed value.
  - Otherwise, if the computed value of ['display'](#) is a value such that the [outer display type](#) is 'inline', then behave as 'inline-block'.
  - Otherwise, behave as 'flow-root'.
- The element is expected to establish a new [formatting context](#) for its contents. The type of this formatting context is determined by its ['display'](#) value, as usual.
- If the element is [absolutely-positioned](#), then for the purpose of the [CSS visual formatting model](#), act as if the element is a [replaced element](#). [\[CSS\]<sup>p1476</sup>](#)
- If the [computed value](#) of ['inline-size'](#) is 'auto', then the [used value](#) is the [fit-content inline size](#).
- For the purpose of the 'normal' keyword of the ['align-self'](#) property, act as if the element is a replaced element.
- If the element is an [input<sup>p520</sup>](#) element, or if it is a [button<sup>p566</sup>](#) element and its computed value for ['display'](#) is not 'inline-grid', 'grid', 'inline-flex', or 'flex', then the element's box has a child **anonymous button content box** with the following behaviors:
  - The box is a [block-level block container](#) that establishes a new [block formatting context](#) (i.e., ['display'](#) is 'flow-root').
  - If the box does not overflow in the horizontal axis, then it is centered horizontally.
  - If the box does not overflow in the vertical axis, then it is centered vertically.

Otherwise, there is no [anonymous button content box<sup>p1411</sup>](#).

Need to define the expected [primitive appearance](#).

### 15.5.4 The [button<sup>p566</sup>](#) element § p14 11

The [button<sup>p566</sup>](#) element, when it generates a [CSS box](#), is expected to depict a button and to use [button layout<sup>p1411</sup>](#) whose [anonymous button content box<sup>p1411</sup>](#)'s contents (if there is an [anonymous button content box<sup>p1411</sup>](#)) are the child boxes the element's box would otherwise have.

### 15.5.5 The [details<sup>p637</sup>](#) and [summary<sup>p643</sup>](#) elements § p14 11

```
CSS @namespace "http://www.w3.org/1999/xhtml";

details, summary {
  display: block;
}
details > summary:first-of-type {
  display: list-item;
  counter-increment: list-item 0;
  list-style: disclosure-closed inside;
}
details[open] > summary:first-of-type {
  list-style-type: disclosure-open;
}
```

The [details<sup>p637</sup>](#) element is expected to have an internal [shadow tree](#) with three child elements:

1. The first child element is a [slot<sup>p675</sup>](#) that is expected to take the [details<sup>p637</sup>](#) element's first [summary<sup>p643</sup>](#) element child, if any. This element has a single child [summary<sup>p643</sup>](#) element called the **default summary** which has text content that is [implementation-defined](#) (and probably locale-specific).  
  
The [summary<sup>p643</sup>](#) element that this slot [represents<sup>p141</sup>](#) is expected to allow the user to request the details be shown or hidden.
2. The second child element is a [slot<sup>p675</sup>](#) that is expected to take the [details<sup>p637</sup>](#) element's remaining descendants, if any. This element has no contents.

This element is expected to match the `::details-content` pseudo-element.

This element is expected to have its [style<sup>p163</sup>](#) attribute set to "display: block; content-visibility: hidden;" when the [details<sup>p637</sup>](#) element does not have an [open<sup>p638</sup>](#) attribute. When it does have the [open<sup>p638</sup>](#) attribute, the [style<sup>p163</sup>](#) attribute is expected to be set to "display: block;".

#### Note

*Because the slots are hidden inside a shadow tree, this [style<sup>p163</sup>](#) attribute is not directly visible to author code. Its impacts, however, are visible. Notably, the choice of content-visibility: hidden instead of, e.g., display: none, impacts the results of various APIs that query layout information.*

3. The third child element is either a [link<sup>p177</sup>](#) or [style<sup>p200</sup>](#) element with the following styles for the [default summary<sup>p1412</sup>](#):

```
CSS
:host summary {
  display: list-item;
  counter-increment: list-item 0;
  list-style: disclosure-closed inside;
}
:host([open]) summary {
  list-style-type: disclosure-open;
}
```

#### Note

*The position of this child element relative to the other two is not observable. This means that implementations might have it in a different order relative to its siblings. Implementations might even associate the style with the shadow tree using a mechanism that is not an element.*

#### Note

*The structure of this shadow tree is observable through the ways that the children of the [details<sup>p637</sup>](#) element and the `::details-content` pseudo-element respond to CSS styles.*

### 15.5.6 The [input<sup>p520</sup>](#) element as a text entry widget § <sup>p14</sup> 12

An [input<sup>p520</sup>](#) element whose [type<sup>p523</sup>](#) attribute is in the [Text<sup>p527</sup>](#), [Telephone<sup>p528</sup>](#), [URL<sup>p529</sup>](#), or [Email<sup>p530</sup>](#) state, is a [devolvable widget](#). Its expected [native appearance](#) is to render as an `'inline-block'` box depicting a one-line text control.

An [input<sup>p520</sup>](#) element whose [type<sup>p523</sup>](#) attribute is in the [Search<sup>p527</sup>](#) state is a [devolvable widget](#). Its expected [native appearance](#) is to render as an `'inline-block'` box depicting a one-line text control. If the [computed value](#) of the element's [appearance](#) property is not `'textfield'`, it may have a distinct style indicating that it is a search field.

An [input<sup>p520</sup>](#) element whose [type<sup>p523</sup>](#) attribute is in the [Password<sup>p531</sup>](#) state is a [devolvable widget](#). Its expected [native appearance](#) is to render as an `'inline-block'` box depicting a one-line text control that obscures data entry.

For [input<sup>p520</sup>](#) elements whose [type<sup>p523</sup>](#) attribute is in one of the above states, the [used value](#) of the `'line-height'` property must be a length value that is no smaller than what the [used value](#) would be for `'line-height: normal'`.

#### Note

*The [used value](#) will not be the actual keyword `'normal'`. Also, this rule does not affect the [computed value](#).*

If these text controls provide a text selection, then, when the user changes the current selection, the user agent is expected to [queue an element task](#)<sup>p1125</sup> on the [user interaction task source](#)<sup>p1134</sup> given the [input](#)<sup>p520</sup> element to [fire an event](#) named [select](#)<sup>p1472</sup> at the element, with the [bubbles](#) attribute initialized to true.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in one of the above states is an [element with default preferred size](#), and user agents are expected to apply the ['field-sizing'](#) CSS property to the element. User agents are expected to determine the [inline size](#) of its [intrinsic size](#) by the following steps:

1. If the ['field-sizing'](#) property on the element has a [computed value](#) of ['content'](#), the [inline size](#) is determined by the text which the element shows. The text is either a [value](#)<sup>p597</sup> or a short hint specified by the [placeholder](#)<sup>p559</sup> attribute. User agents may take the text caret size into account in the [inline size](#).
2. If the element has a [size](#)<sup>p551</sup> attribute, and parsing that attribute's value using the [rules for parsing non-negative integers](#)<sup>p77</sup> doesn't generate an error, return the value obtained from applying the [converting a character width to pixels](#)<sup>p1413</sup> algorithm to the value of the attribute.
3. Otherwise, return the value obtained from applying the [converting a character width to pixels](#)<sup>p1413</sup> algorithm to the number 20.

The [converting a character width to pixels](#) algorithm returns  $(size-1) \times avg + max$ , where *size* is the character width to convert, *avg* is the average character width of the primary font for the element for which the algorithm is being run, in pixels, and *max* is the maximum character width of that same font, also in pixels. (The element's ['letter-spacing'](#) property does not affect the result.)

These text controls are expected to be [scroll containers](#) and support scrolling in the [inline axis](#), but not the [block axis](#).

Need to detail the expected [native appearance](#) and [primitive appearance](#).

### 15.5.7 The [input](#)<sup>p520</sup> element as domain-specific widgets §<sup>p14</sup> 13

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Date](#)<sup>p532</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a date control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Month](#)<sup>p533</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a month control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Week](#)<sup>p534</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a week control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Time](#)<sup>p535</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a time control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Local Date and Time](#)<sup>p536</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a local date and time control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Number](#)<sup>p537</sup> state is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a number control.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Number](#)<sup>p537</sup> state is an [element with default preferred size](#), and user agents are expected to apply the ['field-sizing'](#) CSS property to the element. The [block size](#) of the [intrinsic size](#) is about one line high. If the ['field-sizing'](#) property on the element has a [computed value](#) of ['content'](#), the [inline size](#) of the [intrinsic size](#) is expected to be about as wide as necessary to show the current [value](#)<sup>p597</sup>. Otherwise, the [inline size](#) of the [intrinsic size](#) is expected to be about as wide as necessary to show the widest possible value.

An [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Date](#)<sup>p532</sup>, [Month](#)<sup>p533</sup>, [Week](#)<sup>p534</sup>, [Time](#)<sup>p535</sup>, or [Local Date and Time](#)<sup>p536</sup> state, is expected to be about one line high, and about as wide as necessary to show the widest possible value.

Need to detail the expected [native appearance](#) and [primitive appearance](#).

### 15.5.8 The `input` element as a range control §<sup>p14</sup> 14

An `input` element whose `type` attribute is in the `Range` state is a `non-devolvable widget`. Its expected `native appearance` is to render as an `'inline-block'` box depicting a slider control.

When this control has a `horizontal writing mode`, the control is expected to be a horizontal slider. Its lowest value is on the right if the `'direction'` property has a `computed value` of `'rtl'`, and on the left otherwise. When this control has a `vertical writing mode`, it is expected to be a vertical slider. Its lowest value is on the bottom if the `'direction'` property has a `computed value` of `'rtl'`, and on the top otherwise.

Predefined suggested values (provided by the `list` attribute) are expected to be shown as tick marks on the slider, which the slider can snap to.

Need to detail the expected `primitive appearance`.

### 15.5.9 The `input` element as a color well §<sup>p14</sup> 14

An `input` element whose `type` attribute is in the `Color` state is expected to depict a color well, which, when activated, provides the user with a color picker (e.g. a color wheel or color palette) from which the color can be changed. The element, when it generates a `CSS box`, is expected to use `button layout`, that has no child boxes of the `anonymous button content box`. The `anonymous button content box` is expected to have a `presentational hint` setting the `'background-color'` property to the element's `value`.

Predefined suggested values (provided by the `list` attribute) are expected to be shown in the color picker interface, not on the color well itself.

Need to detail the expected `native appearance` and `primitive appearance`.

### 15.5.10 The `input` element as a checkbox and radio button widgets §<sup>p14</sup> 14

An `input` element whose `type` attribute is in the `Checkbox` state is a `non-devolvable widget` expected to render as an `'inline-block'` box containing a single checkbox control, with no label.

Need to detail the expected `native appearance` and `primitive appearance`.

An `input` element whose `type` attribute is in the `Radio Button` state is a `non-devolvable widget` expected to render as an `'inline-block'` box containing a single radio button control, with no label.

Need to detail the expected `native appearance` and `primitive appearance`.

### 15.5.11 The `input` element as a file upload control §<sup>p14</sup> 14

An `input` element whose `type` attribute is in the `File Upload` state, when it generates a `CSS box`, is expected to render as an `'inline-block'` box containing a span of text giving the filename(s) of the `selected files`, if any, followed by a button that, when activated, provides the user with a file picker from which the selection can be changed. The button is expected to use `button layout` and match the `'::file-selector-button'` pseudo-element. The contents of its `anonymous button content box` are expected to be `implementation-defined` (and possibly locale-specific) text, for example "Choose file".

User agents may handle an `input` element whose `type` attribute is in the `File Upload` state as an `element with default preferred size`, and user agents may apply the `'field-sizing'` CSS property to the element. If the `'field-sizing'` property on the element has a `computed value` of `'content'`, the `intrinsic size` of the element is expected to depend on its content such as the `'::file-selector-button'` pseudo-element and chosen file names.

### 15.5.12 The `input` element as a button

An `input` element whose `type` attribute is in the [Submit Button](#), [Reset Button](#), or [Button](#) state, when it generates a [CSS box](#), is expected to depict a button and use [button layout](#) and the contents of the [anonymous button content box](#) are expected to be the text of the element's `value` attribute, if any, or text derived from the element's `type` attribute in an [implementation-defined](#) (and probably locale-specific) fashion, if not.

### 15.5.13 The `marquee` element

```
CSS @namespace "http://www.w3.org/1999/xhtml";

marquee {
  display: inline-block;
  text-align: initial;
  overflow: hidden !important;
}
```

The `marquee` element, while [turned on](#), is expected to render in an animated fashion according to its attributes as follows:

#### If the element's `behavior` attribute is in the [scroll](#) state

Slide the contents of the element in the direction described by the `direction` attribute as defined below, such that it begins off the start side of the `marquee`, and ends flush with the inner end side.

##### Example

For example, if the `direction` attribute is [left](#) (the default), then the contents would start such that their left edge are off the side of the right edge of the `marquee`'s [content area](#), and the contents would then slide up to the point where the left edge of the contents are flush with the left inner edge of the `marquee`'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#). If the element is still [turned on](#) after this, then the user agent is expected to restart the animation.

#### If the element's `behavior` attribute is in the [slide](#) state

Slide the contents of the element in the direction described by the `direction` attribute as defined below, such that it begins off the start side of the `marquee`, and ends off the end side of the `marquee`.

##### Example

For example, if the `direction` attribute is [left](#) (the default), then the contents would start such that their left edge are off the side of the right edge of the `marquee`'s [content area](#), and the contents would then slide up to the point where the *right* edge of the contents are flush with the left inner edge of the `marquee`'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#). If the element is still [turned on](#) after this, then the user agent is expected to restart the animation.

#### If the element's `behavior` attribute is in the [alternate](#) state

When the [marquee current loop index](#) is even (or zero), slide the contents of the element in the direction described by the `direction` attribute as defined below, such that it begins flush with the start side of the `marquee`, and ends flush with the end side of the `marquee`.

When the [marquee current loop index](#) is odd, slide the contents of the element in the opposite direction than that described by the `direction` attribute as defined below, such that it begins flush with the end side of the `marquee`, and ends flush with the start side of the `marquee`.

##### Example

For example, if the `direction` attribute is [left](#) (the default), then the contents would with their right edge flush with the right inner edge of the `marquee`'s [content area](#), and the contents would then slide up to the point where the *left* edge of the contents are flush with the left inner edge of the `marquee`'s [content area](#).

Once the animation has ended, the user agent is expected to [increment the marquee current loop index](#)<sup>p1433</sup>. If the element is still [turned on](#)<sup>p1432</sup> after this, then the user agent is expected to continue the animation.

The [direction](#)<sup>p1432</sup> attribute has the meanings described in the following table:

<a href="#">direction</a> <sup>p1432</sup> attribute state	Direction of animation	Start edge	End edge	Opposite direction
<a href="#">left</a> <sup>p1432</sup>	← Right to left	Right	Left	→ Left to Right
<a href="#">right</a> <sup>p1432</sup>	→ Left to Right	Left	Right	← Right to left
<a href="#">up</a> <sup>p1432</sup>	↑ Up (Bottom to Top)	Bottom	Top	↓ Down (Top to Bottom)
<a href="#">down</a> <sup>p1432</sup>	↓ Down (Top to Bottom)	Top	Bottom	↑ Up (Bottom to Top)

In any case, the animation should proceed such that there is a delay given by the [marquee scroll interval](#)<sup>p1432</sup> between each frame, and such that the content moves at most the distance given by the [marquee scroll distance](#)<sup>p1432</sup> with each frame.

When a [marquee](#)<sup>p1431</sup> element has a `bgcolor` attribute set, the value is expected to be parsed using the [rules for parsing a legacy color value](#)<sup>p94</sup>, and if that does not return failure, the user agent is expected to treat the attribute as a [presentational hint](#)<sup>p1389</sup> setting the element's `'background-color'` property to the resulting color.

The width and height attributes on a [marquee](#)<sup>p1431</sup> element [map to the dimension properties](#)<sup>p1389</sup> `'width'` and `'height'` on the element respectively.

The [natural height](#) of a [marquee](#)<sup>p1431</sup> element with its [direction](#)<sup>p1432</sup> attribute in the [up](#)<sup>p1432</sup> or [down](#)<sup>p1432</sup> states is 200 [CSS pixels](#).

The `vspace` attribute of a [marquee](#)<sup>p1431</sup> element [maps to the dimension properties](#)<sup>p1389</sup> `'margin-top'` and `'margin-bottom'` on the element. The `hspace` attribute of a [marquee](#)<sup>p1431</sup> element [maps to the dimension properties](#)<sup>p1389</sup> `'margin-left'` and `'margin-right'` on the element.

**15.5.14 The [meter](#)<sup>p589</sup> element** §<sup>p14</sup><sub>16</sub>

```
CSS @namespace "http://www.w3.org/1999/xhtml";

meter { appearance: auto; }
```

The [meter](#)<sup>p589</sup> element is a [devolvable widget](#). Its expected [native appearance](#) is to render as an `'inline-block'` box with a `'block-size'` of `'1em'` and a `'inline-size'` of `'5em'`, a `'vertical-align'` of `'-0.2em'`, and with its contents depicting a gauge.

When this element has a [horizontal writing mode](#)<sup>p1410</sup>, the depiction is expected to be of a horizontal gauge. Its minimum value is on the right if the `'direction'` property has a [computed value](#) of `'rtl'`, and on the left otherwise. When this element has a [vertical writing mode](#)<sup>p1410</sup>, it is expected to depict a vertical gauge. Its minimum value is on the bottom if the `'direction'` property has a [computed value](#) of `'rtl'`, and on the top otherwise.

User agents are expected to use a presentation consistent with platform conventions for gauges, if any.

**Note**  
*Requirements for what must be depicted in the gauge are included in the definition of the [meter](#)<sup>p589</sup> element.*

Need to detail the expected [primitive appearance](#).

**15.5.15 The [progress](#)<sup>p587</sup> element** §<sup>p14</sup><sub>16</sub>

```
CSS @namespace "http://www.w3.org/1999/xhtml";

progress { appearance: auto; }
```

The [progress](#)<sup>p587</sup> element is a [devolvable widget](#). Its expected [native appearance](#) is to render as an `'inline-block'` box with a `'block-size'` of `'1em'` and a `'inline-size'` of `'10em'`, and a `'vertical-align'` of `'-0.2em'`.

When the this element has a [horizontal writing mode](#)<sup>p1410</sup>, the element is expected to be depicted as a horizontal progress bar. The start is on the right and the end is on the left if the ['direction'](#) property on this element has a [computed value](#) of 'rtl', and with the start on the left and the end on the right otherwise. When this element has a [vertical writing mode](#)<sup>p1410</sup>, it is expected to be depicted as a vertical progress bar. The start is on the bottom and the end is on the top if the ['direction'](#) property on this element has a [computed value](#) of 'rtl', and with the start on the top and the end on the bottom otherwise.

User agents are expected to use a presentation consistent with platform conventions for progress bars. In particular, user agents are expected to use different presentations for determinate and indeterminate progress bars. User agents are also expected to vary the presentation based on the dimensions of the element.

#### Note

*Requirements for how to determine if the progress bar is determinate or indeterminate, and what progress a determinate progress bar is to show, are included in the definition of the [progress](#)<sup>p587</sup> element.*

Need to detail the expected [primitive appearance](#).

### 15.5.16 The [select](#)<sup>p568</sup> element §<sup>p14</sup><sub>17</sub>

The [select](#)<sup>p568</sup> element is an [element with default preferred size](#), and user agents are expected to apply the ['field-sizing'](#) CSS property to [select](#)<sup>p568</sup> elements.

A [select](#)<sup>p568</sup> element is either a **list box** or a **drop-down box**, depending on its attributes.

A [select](#)<sup>p568</sup> element whose [multiple](#)<sup>p569</sup> attribute is present is expected to render as a multi-select [list box](#)<sup>p1417</sup>.

A [select](#)<sup>p568</sup> element whose [multiple](#)<sup>p569</sup> attribute is absent, and whose [display size](#)<sup>p569</sup> is greater than 1, is expected to render as a single-select [list box](#)<sup>p1417</sup>.

When the element renders as a [list box](#)<sup>p1417</sup>, it is a [devolvable widget](#) expected to render as an ['inline-block'](#) box. The [inline size](#) of its [intrinsic size](#) is the [width of the select's labels](#)<sup>p1418</sup> plus the width of a scrollbar. The [block size](#) of its [intrinsic size](#) is determined by the following steps:

1. If the ['field-sizing'](#) property on the element has a [computed value](#) of ['content'](#), return the height necessary to contain all rows for items.
2. If the [size](#)<sup>p569</sup> attribute is absent or it has no valid value, return the height necessary to contain four rows.
3. Otherwise, return the height necessary to contain as many rows for items as given by the element's [display size](#)<sup>p569</sup>.

A [select](#)<sup>p568</sup> element whose [multiple](#)<sup>p569</sup> attribute is absent, and whose [display size](#)<sup>p569</sup> is 1, is expected to render as an ['inline-block'](#) one-line [drop-down box](#)<sup>p1417</sup>. The [inline size](#) of its [intrinsic size](#) is the [width of the select's labels](#)<sup>p1418</sup>. If the ['field-sizing'](#) property on the element has a [computed value](#) of ['content'](#), the [inline size](#) of the [intrinsic size](#) depends on the shown text. The shown text is typically the label of an [option](#)<sup>p577</sup> of which [selectedness](#)<sup>p578</sup> is set to true.

When the element renders as a [drop-down box](#)<sup>p1417</sup>, it is a [devolvable widget](#). Its appearance in the devolved state, as well as its appearance when the [computed value](#) of the element's ['appearance'](#) property is ['menu-list-button'](#), is that of a drop-down box, including a "drop-down button", but not necessarily rendered using a native control of the host operating system. In such a state, CSS properties such as ['color'](#), ['background-color'](#), and ['border'](#) should not be disregarded (as is generally permissible when rendering an element according to its [native appearance](#)).

In either case ([list box](#)<sup>p1417</sup> or [drop-down box](#)<sup>p1417</sup>), the element's items are expected to be the element's [list of options](#)<sup>p569</sup>, with the element's [optgroup](#)<sup>p576</sup> element [children](#) providing headers for groups of options where applicable.

An [optgroup](#)<sup>p576</sup> element is expected to be rendered by displaying the element's [label](#)<sup>p576</sup> attribute.

An [option<sup>p577</sup>](#) element is expected to be rendered by displaying the element's [label<sup>p578</sup>](#), indented under its [optgroup<sup>p576</sup>](#) element if it has one.

Each sequence of one or more child [hr<sup>p231</sup>](#) element siblings may be rendered as a single separator.

The **width of the select's labels** is the wider of the width necessary to render the widest [optgroup<sup>p576</sup>](#), and the width necessary to render the widest [option<sup>p577</sup>](#) element in the element's [list of options<sup>p569</sup>](#) (including its indent, if any).

If a [select<sup>p568</sup>](#) element contains a [placeholder label option<sup>p570</sup>](#), the user agent is expected to render that [option<sup>p577</sup>](#) in a manner that conveys that it is a label, rather than a valid option of the control. This can include preventing the [placeholder label option<sup>p570</sup>](#) from being explicitly selected by the user. When the [placeholder label option<sup>p570</sup>](#)'s [selectedness<sup>p578</sup>](#) is true, the control is expected to be displayed in a fashion that indicates that no valid option is currently selected.

User agents are expected to render the labels in a [select<sup>p568</sup>](#) in such a manner that any alignment remains consistent whether the label is being displayed as part of the page or in a menu control.

Need to detail the expected [native appearance](#) and [primitive appearance](#).

### 15.5.17 The [textarea<sup>p579</sup>](#) element § p14 18

The [textarea<sup>p579</sup>](#) element is a [devolvable widget](#) expected to render as an ['inline-block'](#) box depicting a multiline text control. If this multiline text control provides a selection, then, when the user changes the current selection, the user agent is expected to [queue an element task<sup>p1125</sup>](#) on the [user interaction task source<sup>p1134</sup>](#) given the [textarea<sup>p579</sup>](#) element to [fire an event](#) named [select<sup>p1472</sup>](#) at the element, with the [bubbles](#) attribute initialized to true.

The [textarea<sup>p579</sup>](#) element is an [element with default preferred size](#), and user agents are expected to apply the ['field-sizing'](#) CSS property to [textarea<sup>p579</sup>](#) elements.

If the ['field-sizing'](#) property on the element has a [computed value](#) of ['content'](#), the [intrinsic size](#) is determined from the text which the element shows. The text is either a [raw value<sup>p581</sup>](#) or a short hint specified by the [placeholder<sup>p583</sup>](#) attribute. User agents may take the text caret size into account in the [intrinsic size](#). Otherwise, its [intrinsic size](#) is computed from [textarea effective width<sup>p1418</sup>](#) and [textarea effective height<sup>p1418</sup>](#) (as defined below).

The **textarea effective width** of a [textarea<sup>p579</sup>](#) element is  $size \times avg + sbw$ , where *size* is the element's [character width<sup>p582</sup>](#), *avg* is the average character width of the primary font of the element, in [CSS pixels](#), and *sbw* is the width of a scrollbar, in [CSS pixels](#). (The element's ['letter-spacing'](#) property does not affect the result.)

The **textarea effective height** of a [textarea<sup>p579</sup>](#) element is the height in [CSS pixels](#) of the number of lines specified the element's [character height<sup>p582</sup>](#), plus the height of a scrollbar in [CSS pixels](#).

User agents are expected to apply the ['white-space'](#) CSS property to [textarea<sup>p579</sup>](#) elements. For historical reasons, if the element has a [wrap<sup>p582</sup>](#) attribute whose value is an [ASCII case-insensitive](#) match for the string "off", then the user agent is expected to treat the attribute as a [presentational hint<sup>p1389</sup>](#) setting the element's ['white-space'](#) property to 'pre'.

Need to detail the expected [native appearance](#) and [primitive appearance](#).

## 15.6 Frames and framesets § p14 18

User agents are expected to render [frameset<sup>p1433</sup>](#) elements as a box with the height and width of the [viewport](#), with a surface rendered according to the following layout algorithm:

1. The *cols* and *rows* variables are lists of zero or more pairs consisting of a number and a unit, the unit being one of *percentage*, *relative*, and *absolute*.

Use the [rules for parsing a list of dimensions<sup>p81</sup>](#) to parse the value of the element's *cols* attribute, if there is one. Let *cols* be the result, or an empty list if there is no such attribute.

Use the [rules for parsing a list of dimensions](#)<sup>p81</sup> to parse the value of the element's `rows` attribute, if there is one. Let *rows* be the result, or an empty list if there is no such attribute.

- For any of the entries in *cols* or *rows* that have the number zero and the unit *relative*, change the entry's number to one.
- If *cols* has no entries, then add a single entry consisting of the value 1 and the unit *relative* to *cols*.

If *rows* has no entries, then add a single entry consisting of the value 1 and the unit *relative* to *rows*.

- Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values](#)<sup>p1420</sup> using *cols* as the input list, and the width of the surface that the `frameset`<sup>p1433</sup> is being rendered into, in [CSS pixels](#), as the input dimension. Let *sized cols* be the resulting list.

Invoke the algorithm defined below to [convert a list of dimensions to a list of pixel values](#)<sup>p1420</sup> using *rows* as the input list, and the height of the surface that the `frameset`<sup>p1433</sup> is being rendered into, in [CSS pixels](#), as the input dimension. Let *sized rows* be the resulting list.

- Split the surface into a grid of  $w \times h$  rectangles, where  $w$  is the number of entries in *sized cols* and  $h$  is the number of entries in *sized rows*.

Size the columns so that each column in the grid is as many [CSS pixels](#) wide as the corresponding entry in the *sized cols* list.

Size the rows so that each row in the grid is as many [CSS pixels](#) high as the corresponding entry in the *sized rows* list.

- Let *children* be the list of `frame`<sup>p1433</sup> and `frameset`<sup>p1433</sup> elements that are *children* of the `frameset`<sup>p1433</sup> element for which the algorithm was invoked.
- For each row of the grid of rectangles created in the previous step, from top to bottom, run these substeps:
  - For each rectangle in the row, from left to right, run these substeps:

- If there are any elements left in *children*, take the first element in the list, and assign it to the rectangle.

If this is a `frameset`<sup>p1433</sup> element, then recurse the entire `frameset`<sup>p1433</sup> layout algorithm for that `frameset`<sup>p1433</sup> element, with the rectangle as the surface.

Otherwise, it is a `frame`<sup>p1433</sup> element; render its [content navigable](#)<sup>p991</sup>, positioned and sized to fit the rectangle.

- If there are any elements left in *children*, remove the first element from *children*.

- If the `frameset`<sup>p1433</sup> element [has a border](#)<sup>p1419</sup>, draw an outer set of borders around the rectangles, using the element's [frame border color](#)<sup>p1419</sup>.

For each rectangle, if there is an element assigned to that rectangle, and that element [has a border](#)<sup>p1419</sup>, draw an inner set of borders around that rectangle, using the element's [frame border color](#)<sup>p1419</sup>.

For each (visible) border that does not abut a rectangle that is assigned a `frame`<sup>p1433</sup> element with a `noresize` attribute (including rectangles in further nested `frameset`<sup>p1433</sup> elements), the user agent is expected to allow the user to move the border, resizing the rectangles within, keeping the proportions of any nested `frameset`<sup>p1433</sup> grids.

A `frameset`<sup>p1433</sup> or `frame`<sup>p1433</sup> element **has a border** if the following algorithm returns true:

- If the element has a `frameborder` attribute whose value is not the empty string and whose first character is either a U+0031 DIGIT ONE (1) character, a U+0079 LATIN SMALL LETTER Y character (y), or a U+0059 LATIN CAPITAL LETTER Y character (Y), then return true.
- Otherwise, if the element has a `frameborder` attribute, return false.
- Otherwise, if the element has a parent element that is a `frameset`<sup>p1433</sup> element, then return true if *that* element [has a border](#)<sup>p1419</sup>, and false if it does not.
- Otherwise, return true.

The **frame border color** of a `frameset`<sup>p1433</sup> or `frame`<sup>p1433</sup> element is the color obtained from the following algorithm:

- If the element has a `bordercolor` attribute, and applying the [rules for parsing a legacy color value](#)<sup>p94</sup> to that attribute's value does not return failure, then return the color so obtained.
- Otherwise, if the element has a parent element that is a `frameset`<sup>p1433</sup> element, then return the [frame border](#)

[color](#)<sup>p1419</sup> of that element.

3. Otherwise, return gray.

The algorithm to **convert a list of dimensions to a list of pixel values** consists of the following steps:

1. Let *input list* be the list of numbers and units passed to the algorithm.  
Let *output list* be a list of numbers the same length as *input list*, all zero.  
Entries in *output list* correspond to the entries in *input list* that have the same position.
2. Let *input dimension* be the size passed to the algorithm.
3. Let *count percentage* be the number of entries in *input list* whose unit is *percentage*.  
Let *total percentage* be the sum of all the numbers in *input list* whose unit is *percentage*.  
Let *count relative* be the number of entries in *input list* whose unit is *relative*.  
Let *total relative* be the sum of all the numbers in *input list* whose unit is *relative*.  
Let *count absolute* be the number of entries in *input list* whose unit is *absolute*.  
Let *total absolute* be the sum of all the numbers in *input list* whose unit is *absolute*.  
Let *remaining space* be the value of *input dimension*.
4. If *total absolute* is greater than *remaining space*, then for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total absolute*. Then, set *remaining space* to zero.  
  
Otherwise, for each entry in *input list* whose unit is *absolute*, set the corresponding value in *output list* to the number of the entry in *input list*. Then, decrement *remaining space* by *total absolute*.
5. If *total percentage* multiplied by the *input dimension* and divided by 100 is greater than *remaining space*, then for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total percentage*. Then, set *remaining space* to zero.  
  
Otherwise, for each entry in *input list* whose unit is *percentage*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by the *input dimension* and divided by 100. Then, decrement *remaining space* by *total percentage* multiplied by the *input dimension* and divided by 100.
6. For each entry in *input list* whose unit is *relative*, set the corresponding value in *output list* to the number of the entry in *input list* multiplied by *remaining space* and divided by *total relative*.
7. Return *output list*.

User agents working with integer values for frame widths (as opposed to user agents that can lay frames out with subpixel accuracy) are expected to distribute the remainder first to the last entry whose unit is *relative*, then equally (not proportionally) to each entry whose unit is *percentage*, then equally (not proportionally) to each entry whose unit is *absolute*, and finally, failing all else, to the last entry.

The contents of a [frame](#)<sup>p1433</sup> element that does not have a [frameset](#)<sup>p1433</sup> parent are expected to be rendered as [transparent black](#); the user agent is expected to not render its [content navigable](#)<sup>p991</sup> in this case, and its [content navigable](#)<sup>p991</sup> is expected to have a [viewport](#) with zero width and zero height.

## 15.7 Interactive media <sup>p14</sup><sub>20</sub>

### 15.7.1 Links, forms, and navigation <sup>p14</sup><sub>20</sub>

User agents are expected to allow the user to control aspects of [hyperlink](#)<sup>p302</sup> activation and [form submission](#)<sup>p628</sup>, such as which [navigable](#)<sup>p989</sup> is to be used for the subsequent [navigation](#)<sup>p1014</sup>.

User agents are expected to allow users to discover the destination of [hyperlinks](#)<sup>p302</sup> and of [forms](#)<sup>p514</sup> before triggering their

[navigation](#)<sup>p1014</sup>.

User agents are expected to inform the user of whether a [hyperlink](#)<sup>p302</sup> includes [hyperlink auditing](#)<sup>p312</sup>, and to let them know at a minimum which domains will be contacted as part of such auditing.

User agents may allow users to [navigate](#)<sup>p1014</sup> [navigables](#)<sup>p989</sup> to the URLs [indicated](#)<sup>p97</sup> by the `cite` attributes on [q](#)<sup>p266</sup>, [blockquote](#)<sup>p235</sup>, [ins](#)<sup>p337</sup>, and [del](#)<sup>p338</sup> elements.

User agents may surface [hyperlinks](#)<sup>p302</sup> created by [link](#)<sup>p177</sup> elements in their user interface, as discussed [previously](#)<sup>p189</sup>.

### 15.7.2 The [title](#)<sup>p157</sup> attribute §<sup>p14</sup><sub>21</sub>

User agents are expected to expose the [advisory information](#)<sup>p157</sup> of elements upon user request, and to make the user aware of the presence of such information.

On interactive graphical systems where the user can use a pointing device, this could take the form of a tooltip. When the user is unable to use a pointing device, then the user agent is expected to make the content available in some other fashion, e.g. by making the element a [focusable area](#)<sup>p835</sup> and always displaying the [advisory information](#)<sup>p157</sup> of the currently [focused](#)<sup>p836</sup> element, or by showing the [advisory information](#)<sup>p157</sup> of the elements under the user's finger on a touch device as the user pans around the screen.

U+000A LINE FEED (LF) characters are expected to cause line breaks in the tooltip; U+0009 CHARACTER TABULATION (tab) characters are expected to render as a nonzero horizontal shift that lines up the next glyph with the next tab stop, with tab stops occurring at points that are multiples of 8 times the width of a U+0020 SPACE character.

#### Example

For example, a visual user agent could make elements with a [title](#)<sup>p157</sup> attribute [focusable](#)<sup>p837</sup>, and could make any [focused](#)<sup>p836</sup> element with a [title](#)<sup>p157</sup> attribute show its tooltip under the element while the element has focus. This would allow a user to tab around the document to find all the advisory text.

#### Example

As another example, a screen reader could provide an audio cue when reading an element with a tooltip, with an associated key to read the last tooltip for which a cue was played.

### 15.7.3 Editing hosts §<sup>p14</sup><sub>21</sub>

The current text editing caret (i.e. the [active range](#), if it is empty and in an [editing host](#)<sup>p855</sup>), if any, is expected to act like an inline [replaced element](#) with the vertical dimensions of the caret and with zero width for the purposes of the CSS rendering model.

#### Note

*This means that even an empty block can have the caret inside it, and that when the caret is in such an element, it prevents margins from collapsing through the element.*

### 15.7.4 Text rendered in native user interfaces §<sup>p14</sup><sub>21</sub>

User agents are expected to honor the Unicode semantics of text that is exposed in user interfaces, for example supporting the bidirectional algorithm in text shown in dialogs, title bars, popup menus, and tooltips. Text from the contents of elements is expected to be rendered in a manner that honors [the directionality](#)<sup>p160</sup> of the element from which the text was obtained. Text from attributes is expected to be rendered in a manner that honours the [directionality of the attribute](#)<sup>p162</sup>.

#### Example

Consider the following markup, which has Hebrew text asking for a programming language, the languages being text for which a left-to-right direction is important given the punctuation in some of their names:

```

<p dir="rtl" lang="he">
  <label>
    בחר שפת תכנות:
  > select>
    <option dir="ltr">C++</option>
    <option dir="ltr">C#</option>
    <option dir="ltr">FreePascal</option>
    <option dir="ltr">F#</option>
  </select>
</label>
</p>

```

If the [select](#)<sup>p568</sup> element was rendered as a drop down box, a correct rendering would ensure that the punctuation was the same both in the drop down, and in the box showing the current selection.

## Example

The directionality of attributes depends on the attribute and on the element's [dir](#)<sup>p160</sup> attribute, as the following example demonstrates. Consider this markup:

```

<table>
  <tr>
    <th abbr="(λ" dir=ltr>A
    <th abbr="(λ" dir=rtl>A
    <th abbr="(λ" dir=auto>A
  </tr>
</table>

```

If the [abbr](#)<sup>p495</sup> attributes are rendered, e.g. in a tooltip or other user interface, the first will have a left parenthesis (because the direction is 'ltr'), the second will have a right parenthesis (because the direction is 'rtl'), and the third will have a right parenthesis (because the direction is determined *from the attribute value* to be 'rtl').

However, if instead the attribute was not a [directionality-capable attribute](#)<sup>p162</sup>, the results would be different:

```

<table>
  <tr>
    <th data-abbrev="(λ" dir=ltr>A
    <th data-abbrev="(λ" dir=rtl>A
    <th data-abbrev="(λ" dir=auto>A
  </tr>
</table>

```

In this case, if the user agent were to expose the `data-abbrev` attribute in the user interface (e.g. in a debugging environment), the last case would be rendered with a *left* parenthesis, because the direction would be determined from the element's contents.

A string provided by a script (e.g. the argument to [window.alert\(\)](#)<sup>p1167</sup>) is expected to be treated as an independent set of one or more bidirectional algorithm paragraphs when displayed, as defined by the bidirectional algorithm, including, for instance, supporting the paragraph-breaking behavior of U+000A LINE FEED (LF) characters. For the purposes of determining the paragraph level of such text in the bidirectional algorithm, this specification does *not* provide a higher-level override of rules P2 and P3. [\[BIDI\]](#)<sup>p1475</sup>

When necessary, authors can enforce a particular direction for a given paragraph by starting it with the Unicode U+200E LEFT-TO-RIGHT MARK or U+200F RIGHT-TO-LEFT MARK characters.

### Example

Thus, the following script:

```
alert('\u05DC\u05DE\u05D3 HTML \u05D4\u05D9\u05D5\u05DD!')
```

...would always result in a message reading "למוד HTML היום!" (not "היום HTML למד!"), regardless of the language of the user agent interface or the direction of the page or any of its elements.

### Example

For a more complex example, consider the following script:

```
/* Warning: this script does not handle right-to-left scripts correctly */
var s;
if (s = prompt('What is your name?')) {
  alert(s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
```

When the user enters "Kitty", the user agent would alert "Kitty! Ok, Fred, Kitty, and Wilma will get the car.". However, if the user enters "لا أفهم", then the bidirectional algorithm will determine that the direction of the paragraph is right-to-left, and so the output will be the following unintended mess: "لا أفهم! Ok, Fred, لا أفهم, and Wilma will get the car."

To force an alert that starts with user-provided text (or other text of unknown directionality) to render left-to-right, the string can be prefixed with a U+200E LEFT-TO-RIGHT MARK character:

```
var s;
if (s = prompt('What is your name?')) {
  alert('\u200E' + s + '! Ok, Fred, ' + s + ', and Wilma will get the car.');
```

## 15.8 Print media § p14 23

User agents are expected to allow the user to request the opportunity to **obtain a physical form** (or a representation of a physical form) of a [Document](#)<sup>p130</sup>. For example, selecting the option to print a page or convert it to PDF format. [\[PDF\]](#)<sup>p1480</sup>

When the user actually [obtains a physical form](#)<sup>p1423</sup> (or a representation of a physical form) of a [Document](#)<sup>p130</sup>, the user agent is expected to create a new rendering of the [Document](#)<sup>p130</sup> for the print media.

## 15.9 Unstyled XML documents § p14 23

HTML user agents may, in certain circumstances, find themselves rendering non-HTML documents that use vocabularies for which they lack any built-in knowledge. This section provides for a way for user agents to handle such documents in a somewhat useful manner.

While a [Document](#)<sup>p130</sup> is an [unstyled document](#)<sup>p1423</sup>, the user agent is expected to render [an unstyled document view](#)<sup>p1424</sup>.

A [Document](#)<sup>p130</sup> is an **unstyled document** while it matches the following conditions:

- The [Document](#)<sup>p130</sup> has no author style sheets (whether referenced by HTTP headers, processing instructions, elements like [link](#)<sup>p177</sup>, inline elements like [style](#)<sup>p200</sup>, or any other mechanism).
- None of the elements in the [Document](#)<sup>p130</sup> have any [presentational hints](#)<sup>p1389</sup>.
- None of the elements in the [Document](#)<sup>p130</sup> have any [style attributes](#).
- None of the elements in the [Document](#)<sup>p130</sup> are in any of the following namespaces: [HTML namespace](#), [SVG namespace](#), [MathML namespace](#)
- The [Document](#)<sup>p130</sup> has no [focusable area](#)<sup>p835</sup> (e.g. from XLink) other than the [viewport](#).

- The [Document](#)<sup>p130</sup> has no [hyperlinks](#)<sup>p302</sup> (e.g. from XLink).
- There exists no [script](#)<sup>p1084</sup> whose [settings object](#)<sup>p1084</sup>'s [global object](#)<sup>p1077</sup> is a [Window](#)<sup>p922</sup> object with this [Document](#)<sup>p130</sup> as its [associated Document](#)<sup>p923</sup>.
- None of the elements in the [Document](#)<sup>p130</sup> have any registered event listeners.

**An unstyled document view** is one where the DOM is not rendered according to CSS (which would, since there are no applicable styles in this context, just result in a wall of text), but is instead rendered in a manner that is useful for a developer. This could consist of just showing the [Document](#)<sup>p130</sup> object's source, maybe with syntax highlighting, or it could consist of displaying just the DOM tree, or simply a message saying that the page is not a styled document.

#### Note

*If a [Document](#)<sup>p130</sup> stops being an [unstyled document](#)<sup>p1423</sup>, then the conditions above stop applying, and thus a user agent following these requirements will switch to using the regular CSS rendering.*

## 16 Obsolete features §<sup>p14</sup> 25

### 16.1 Obsolete but conforming features §<sup>p14</sup> 25

Features listed in this section will trigger warnings in conformance checkers.

Authors should not specify a [border<sup>p1438</sup>](#) attribute on an [img<sup>p346</sup>](#) element. If the attribute is present, its value must be the string "0". CSS should be used instead.

Authors should not specify a [charset<sup>p1427</sup>](#) attribute on a [script<sup>p652</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for "utf-8". (This has no effect in a document that conforms to the requirements elsewhere in this standard of being encoded as [UTF-8](#).)

Authors should not specify a [language<sup>p1429</sup>](#) attribute on a [script<sup>p652</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for the string "JavaScript" and either the [type<sup>p653</sup>](#) attribute must be omitted or its value must be an [ASCII case-insensitive](#) match for the string "text/javascript". The attribute should be entirely omitted instead (with the value "JavaScript", it has no effect), or replaced with use of the [type<sup>p653</sup>](#) attribute.

Authors should not specify a value for the [type<sup>p653</sup>](#) attribute on [script<sup>p652</sup>](#) elements that is the empty string or a [JavaScript MIME type essence match](#). Instead, they should omit the attribute, which has the same effect.

Authors should not specify a [type<sup>p1429</sup>](#) attribute on a [style<sup>p288</sup>](#) element. If the attribute is present, its value must be an [ASCII case-insensitive](#) match for "[text/css<sup>p1474</sup>](#)".

Authors should not specify the [name<sup>p1427</sup>](#) attribute on [a<sup>p257</sup>](#) elements. If the attribute is present, its value must not be the empty string and must neither be equal to the value of any of the [IDs](#) in the element's [tree](#) other than the element's own [ID](#), if any, nor be equal to the value of any of the other [name<sup>p1427</sup>](#) attributes on [a<sup>p257</sup>](#) elements in the element's [tree](#). If this attribute is present and the element has an [ID](#), then the attribute's value must be equal to the element's [ID](#). In earlier versions of the language, this attribute was intended as a way to specify possible targets for [fragments](#) in [URLs](#). The [id<sup>p154</sup>](#) attribute should be used instead.

Authors should not, but may despite requirements to the contrary elsewhere in this specification, specify the [maxlength<sup>p551</sup>](#) and [size<sup>p551</sup>](#) attributes on [input<sup>p528</sup>](#) elements whose [type<sup>p523</sup>](#) attributes are in the [Number<sup>p537</sup>](#) state. One valid reason for using these attributes regardless is to help legacy user agents that do not support [input<sup>p528</sup>](#) elements with [type](#)="number" to still render the text control with a useful width.

#### 16.1.1 Warnings for obsolete but conforming features §<sup>p14</sup> 25

To ease the transition from HTML4 Transitional documents to the language defined in *this* specification, and to discourage certain features that are only allowed in very few circumstances, conformance checkers must warn the user when the following features are used in a document. These are generally old obsolete features that have no effect, and are allowed only to distinguish between likely mistakes (regular conformance errors) and mere vestigial markup or unusual and discouraged practices (these warnings).

The following features must be categorized as described above:

- The presence of a [border<sup>p1438</sup>](#) attribute on an [img<sup>p346</sup>](#) element if its value is the string "0".
- The presence of a [charset<sup>p1427</sup>](#) attribute on a [script<sup>p652</sup>](#) element if its value is an [ASCII case-insensitive](#) match for "utf-8".
- The presence of a [language<sup>p1429</sup>](#) attribute on a [script<sup>p652</sup>](#) element if its value is an [ASCII case-insensitive](#) match for the string "JavaScript" and if there is no [type<sup>p653</sup>](#) attribute or there is and its value is an [ASCII case-insensitive](#) match for the string "text/javascript".
- The presence of a [type<sup>p1429</sup>](#) attribute on a [script<sup>p652</sup>](#) element if its value is a [JavaScript MIME type essence match](#).
- The presence of a [type<sup>p1429</sup>](#) attribute on a [style<sup>p288</sup>](#) element if its value is an [ASCII case-insensitive](#) match for "[text/css<sup>p1474</sup>](#)".
- The presence of a [name<sup>p1427</sup>](#) attribute on an [a<sup>p257</sup>](#) element, if its value is not the empty string.
- The presence of a [maxlength<sup>p551</sup>](#) attribute on an [input<sup>p528</sup>](#) element whose [type<sup>p523</sup>](#) attribute is in the [Number<sup>p537</sup>](#) state.

- The presence of a [size](#)<sup>p551</sup> attribute on an [input](#)<sup>p520</sup> element whose [type](#)<sup>p523</sup> attribute is in the [Number](#)<sup>p537</sup> state.

Conformance checkers must distinguish between pages that have no conformance errors and have none of these obsolete features, and pages that have no conformance errors but do have some of these obsolete features.

#### Example

For example, a validator could report some pages as "Valid HTML" and others as "Valid HTML with warnings".

## 16.2 Non-conforming features <sup>§<sup>p14</sup><sub>26</sub></sup>

Elements in the following list are entirely obsolete, and must not be used by authors:

### applet

Use [embed](#)<sup>p399</sup> or [object](#)<sup>p402</sup> instead.

### acronym

Use [abbr](#)<sup>p269</sup> instead.

### bgsound

Use [audio](#)<sup>p410</sup> instead.

### dir

Use [ul](#)<sup>p239</sup> instead.

### [frame](#)<sup>p1433</sup>

### [frameset](#)<sup>p1433</sup>

### noframes

Either use [iframe](#)<sup>p390</sup> and CSS instead, or use server-side includes to generate complete pages with the various invariant parts merged in.

### isindex

Use an explicit [form](#)<sup>p514</sup> and [text control](#)<sup>p527</sup> combination instead.

### keygen

For enterprise device management use cases, use native on-device management capabilities.

For certificate enrollment use cases, use the Web Cryptography API to generate a keypair for the certificate, and then export the certificate and key to allow the user to install them manually. [\[WEBCRYPTO\]](#)<sup>p1483</sup>

### listing

Use [pre](#)<sup>p233</sup> and [code](#)<sup>p286</sup> instead.

### menuitem

To implement a custom context menu, use script to handle the [contextmenu](#) event.

### nextid

Use GUIDs instead.

### noembed

Use [object](#)<sup>p402</sup> instead of [embed](#)<sup>p399</sup> when fallback is necessary.

### param

Use the [data](#)<sup>p403</sup> attribute of the [object](#)<sup>p402</sup> element to set the URL of the external resource.

### plaintext

Use the "[text/plain](#)" [MIME type](#) instead.

**rb**  
**rtc**  
Providing the ruby base directly inside the [ruby](#)<sup>p270</sup> element or using nested [ruby](#)<sup>p270</sup> elements is sufficient.

**strike**  
Use [del](#)<sup>p338</sup> instead if the element is marking an edit, otherwise use [s](#)<sup>p264</sup> instead.

**xmp**  
Use [pre](#)<sup>p233</sup> and [code](#)<sup>p286</sup> instead, and escape "<" and "&" characters as "&lt;" and "&amp;" respectively.

**basefont**  
**big**  
**blink**  
**center**  
**font**  
[marquee](#)<sup>p1431</sup>  
**multicol**  
**nobr**  
**spacer**  
**tt**

Use appropriate elements or CSS instead.

Where the [tt](#)<sup>p1427</sup> element would have been used for marking up keyboard input, consider the [kbd](#)<sup>p289</sup> element; for variables, consider the [var](#)<sup>p287</sup> element; for computer code, consider the [code](#)<sup>p286</sup> element; and for computer output, consider the [samp](#)<sup>p288</sup> element.

Similarly, if the [big](#)<sup>p1427</sup> element is being used to denote a heading, consider using the [h1](#)<sup>p216</sup> element; if it is being used for marking up important passages, consider the [strong](#)<sup>p261</sup> element; and if it is being used for highlighting text for reference purposes, consider the [mark](#)<sup>p294</sup> element.

See also the [text-level semantics usage summary](#)<sup>p301</sup> for more suggestions with examples.

The following attributes are obsolete (though the elements are still part of the language), and must not be used by authors:

**charset on [a](#)**<sup>p257</sup> **elements**

**charset on [link](#)**<sup>p177</sup> **elements**

Use an HTTP `Content-Type`<sup>p98</sup> header on the linked resource instead.

**charset on [script](#)**<sup>p652</sup> **elements (except as noted in the previous section)**

Omit the attribute. Both documents and scripts are required to use [UTF-8](#), so it is redundant to specify it on the [script](#)<sup>p652</sup> element since it inherits from the document.

**coords on [a](#)**<sup>p257</sup> **elements**

**shape on [a](#)**<sup>p257</sup> **elements**

Use [area](#)<sup>p471</sup> instead of [a](#)<sup>p257</sup> for image maps.

**methods on [a](#)**<sup>p257</sup> **elements**

**methods on [link](#)**<sup>p177</sup> **elements**

Use the HTTP OPTIONS feature instead.

**name on [a](#)**<sup>p257</sup> **elements (except as noted in the previous section)**

**name on [embed](#)**<sup>p399</sup> **elements**

**name on [img](#)**<sup>p346</sup> **elements**

**name on [option](#)**<sup>p577</sup> **elements**

Use the [id](#)<sup>p154</sup> attribute instead.

**rev on [a](#)<sup>p257</sup> elements****rev on [link](#)<sup>p177</sup> elements**

Use the [rel](#)<sup>p303</sup> attribute instead, with an opposite term. (For example, instead of `rev="made"`, use `rel="author"`.)

**urn on [a](#)<sup>p257</sup> elements****urn on [link](#)<sup>p177</sup> elements**

Specify the preferred persistent identifier using the [href](#)<sup>p303</sup> attribute instead.

**accept on [form](#)<sup>p514</sup> elements**

Use the [accept](#)<sup>p544</sup> attribute directly on the [input](#)<sup>p520</sup> elements instead.

**hreflang on [area](#)<sup>p471</sup> elements****type on [area](#)<sup>p471</sup> elements**

These attributes do not do anything useful, and for historical reasons there are no corresponding IDL attributes on [area](#)<sup>p471</sup> elements. Omit them altogether.

**nohref on [area](#)<sup>p471</sup> elements**

Omitting the [href](#)<sup>p303</sup> attribute is sufficient; the [nohref](#)<sup>p1428</sup> attribute is unnecessary. Omit it altogether.

**profile on [head](#)<sup>p173</sup> elements**

Unnecessary. Omit it altogether.

**manifest on [html](#)<sup>p172</sup> elements**

Use service workers instead. [\[SW\]](#)<sup>p1482</sup>

**version on [html](#)<sup>p172</sup> elements**

Unnecessary. Omit it altogether.

**ismap on [input](#)<sup>p520</sup> elements**

Unnecessary. Omit it altogether. All [input](#)<sup>p520</sup> elements with a [type](#)<sup>p523</sup> attribute in the [Image Button](#)<sup>p547</sup> state are processed as server-side image maps.

**usemap on [input](#)<sup>p520</sup> elements****usemap on [object](#)<sup>p402</sup> elements**

Use the [img](#)<sup>p346</sup> element for image maps.

**longdesc on [iframe](#)<sup>p390</sup> elements****longdesc on [img](#)<sup>p346</sup> elements**

Use a regular [a](#)<sup>p257</sup> element to link to the description, or (in the case of images) use an [image map](#)<sup>p473</sup> to provide a link from the image to the image's description.

**lowsrc on [img](#)<sup>p346</sup> elements**

Use a progressive JPEG image (given in the [src](#)<sup>p347</sup> attribute), instead of using two separate images.

**target on [link](#)<sup>p177</sup> elements**

Unnecessary. Omit it altogether.

**type on [menu](#)<sup>p240</sup> elements**

To implement a custom context menu, use script to handle the [contextmenu](#) event. For toolbar menus, omit the attribute.

**label on [menu](#)<sup>p240</sup> elements****contextmenu on all elements****onshow on all elements**

To implement a custom context menu, use script to handle the [contextmenu](#) event.

**scheme on [meta](#)<sup>p189</sup> elements**

Use only one scheme per field, or make the scheme declaration part of the value.

**archive on [object](#)<sup>p402</sup> elements**

**classid on [object](#)<sup>p402</sup> elements**

**code on [object](#)<sup>p402</sup> elements**

**codebase on [object](#)<sup>p402</sup> elements**

**codetype on [object](#)<sup>p402</sup> elements**

Use the [data](#)<sup>p403</sup> and [type](#)<sup>p403</sup> attributes to invoke [plugins](#)<sup>p47</sup>.

**declare on [object](#)<sup>p402</sup> elements**

Repeat the [object](#)<sup>p402</sup> element completely each time the resource is to be reused.

**standby on [object](#)<sup>p402</sup> elements**

Optimize the linked resource so that it loads quickly or, at least, incrementally.

**typemustmatch on [object](#)<sup>p402</sup> elements**

Avoid using [object](#)<sup>p402</sup> elements with untrusted resources.

**language on [script](#)<sup>p652</sup> elements (except as noted in the previous section)**

Omit the attribute for JavaScript; for [data blocks](#)<sup>p653</sup>, use the [type](#)<sup>p653</sup> attribute instead.

**event on [script](#)<sup>p652</sup> elements**

**for on [script](#)<sup>p652</sup> elements**

Use DOM events mechanisms to register event listeners. [\[DOM\]](#)<sup>p1478</sup>

**type on [style](#)<sup>p200</sup> elements (except as noted in the previous section)**

Omit the attribute for CSS; for [data blocks](#)<sup>p653</sup>, use [script](#)<sup>p652</sup> as the container instead of [style](#)<sup>p200</sup>.

**datapagesize on [table](#)<sup>p478</sup> elements**

Unnecessary. Omit it altogether.

**summary on [table](#)<sup>p478</sup> elements**

Use one of the [techniques for describing tables](#)<sup>p482</sup> given in the [table](#)<sup>p478</sup> section instead.

**abbr on [td](#)<sup>p493</sup> elements**

Use text that begins in an unambiguous and terse manner, and include any more elaborate text after that. The [title](#)<sup>p157</sup> attribute can also be useful in including more detailed text, so that the cell's contents can be made terse. If it's a heading, use [th](#)<sup>p495</sup> (which has an [abbr](#)<sup>p495</sup> attribute).

**axis on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements**

Use the [scope](#)<sup>p495</sup> attribute on the relevant [th](#)<sup>p495</sup>.

**scope on [td](#)<sup>p493</sup> elements**

Use [th](#)<sup>p495</sup> elements for heading cells.

**[datasrc](#) on [a](#)<sup>p257</sup>, [button](#)<sup>p566</sup>, [div](#)<sup>p256</sup>, [frame](#)<sup>p1433</sup>, [iframe](#)<sup>p390</sup>, [img](#)<sup>p346</sup>, [input](#)<sup>p520</sup>, [label](#)<sup>p518</sup>, [legend](#)<sup>p596</sup>, [marquee](#)<sup>p1431</sup>, [object](#)<sup>p402</sup>, [option](#)<sup>p577</sup>, [select](#)<sup>p568</sup>, [span](#)<sup>p298</sup>, [table](#)<sup>p478</sup>, and [textarea](#)<sup>p579</sup> elements**

**[datafld](#) on [a](#)<sup>p257</sup>, [button](#)<sup>p566</sup>, [div](#)<sup>p256</sup>, [fieldset](#)<sup>p594</sup>, [frame](#)<sup>p1433</sup>, [iframe](#)<sup>p390</sup>, [img](#)<sup>p346</sup>, [input](#)<sup>p520</sup>, [label](#)<sup>p518</sup>, [legend](#)<sup>p596</sup>, [marquee](#)<sup>p1431</sup>, [object](#)<sup>p402</sup>, [select](#)<sup>p568</sup>, [span](#)<sup>p298</sup>, and [textarea](#)<sup>p579</sup> elements**

**[dataformatas](#) on [button](#)<sup>p566</sup>, [div](#)<sup>p256</sup>, [input](#)<sup>p520</sup>, [label](#)<sup>p518</sup>, [legend](#)<sup>p596</sup>, [marquee](#)<sup>p1431</sup>, [object](#)<sup>p402</sup>, [option](#)<sup>p577</sup>, [select](#)<sup>p568</sup>, [span](#)<sup>p298</sup>, and [table](#)<sup>p478</sup> elements**

Use script and a mechanism such as [XMLHttpRequest](#) to populate the page dynamically. [\[XHR\]](#)<sup>p1484</sup>

**dropzone on all elements**

Use script to handle the [dragenter](#)<sup>p884</sup> and [dragover](#)<sup>p884</sup> events instead.

**alink** on [body<sup>p205</sup>](#) elements  
**bgcolor** on [body<sup>p205</sup>](#) elements  
**bottommargin** on [body<sup>p205</sup>](#) elements  
**leftmargin** on [body<sup>p205</sup>](#) elements  
**link** on [body<sup>p205</sup>](#) elements  
**marginheight** on [body<sup>p205</sup>](#) elements  
**marginwidth** on [body<sup>p205</sup>](#) elements  
**rightmargin** on [body<sup>p205</sup>](#) elements  
**text** on [body<sup>p205</sup>](#) elements  
**topmargin** on [body<sup>p205</sup>](#) elements  
**vlink** on [body<sup>p205</sup>](#) elements  
**clear** on [br<sup>p299</sup>](#) elements  
**align** on [caption<sup>p486</sup>](#) elements  
**align** on [col<sup>p488</sup>](#) elements  
**char** on [col<sup>p488</sup>](#) elements  
**charoff** on [col<sup>p488</sup>](#) elements  
**valign** on [col<sup>p488</sup>](#) elements  
**width** on [col<sup>p488</sup>](#) elements  
**align** on [div<sup>p256</sup>](#) elements  
**compact** on [dl<sup>p244</sup>](#) elements  
**align** on [embed<sup>p399</sup>](#) elements  
**hspace** on [embed<sup>p399</sup>](#) elements  
**vspace** on [embed<sup>p399</sup>](#) elements  
**align** on [hr<sup>p231</sup>](#) elements  
**color** on [hr<sup>p231</sup>](#) elements  
**noshade** on [hr<sup>p231</sup>](#) elements  
**size** on [hr<sup>p231</sup>](#) elements  
**width** on [hr<sup>p231</sup>](#) elements  
**align** on [h1<sup>p216</sup>](#)—[h6<sup>p216</sup>](#) elements  
**align** on [iframe<sup>p390</sup>](#) elements  
**allowtransparency** on [iframe<sup>p390</sup>](#) elements  
**frameborder** on [iframe<sup>p390</sup>](#) elements  
**framespacing** on [iframe<sup>p390</sup>](#) elements  
**hspace** on [iframe<sup>p390</sup>](#) elements  
**marginheight** on [iframe<sup>p390</sup>](#) elements  
**marginwidth** on [iframe<sup>p390</sup>](#) elements  
**scrolling** on [iframe<sup>p390</sup>](#) elements  
**vspace** on [iframe<sup>p390</sup>](#) elements  
**align** on [input<sup>p520</sup>](#) elements  
**border** on [input<sup>p520</sup>](#) elements  
**hspace** on [input<sup>p520</sup>](#) elements  
**vspace** on [input<sup>p520</sup>](#) elements  
**align** on [img<sup>p346</sup>](#) elements  
**border** on [img<sup>p346</sup>](#) elements (except as noted in the previous section)  
**hspace** on [img<sup>p346</sup>](#) elements  
**vspace** on [img<sup>p346</sup>](#) elements  
**align** on [legend<sup>p596</sup>](#) elements  
**type** on [li<sup>p241</sup>](#) elements  
**compact** on [menu<sup>p240</sup>](#) elements  
**align** on [object<sup>p402</sup>](#) elements  
**border** on [object<sup>p402</sup>](#) elements  
**hspace** on [object<sup>p402</sup>](#) elements  
**vspace** on [object<sup>p402</sup>](#) elements

**compact** on [ol](#)<sup>p238</sup> elements  
**align** on [p](#)<sup>p229</sup> elements  
**width** on [pre](#)<sup>p233</sup> elements  
**align** on [table](#)<sup>p478</sup> elements  
**bgcolor** on [table](#)<sup>p478</sup> elements  
**border** on [table](#)<sup>p478</sup> elements  
**bordercolor** on [table](#)<sup>p478</sup> elements  
**cellpadding** on [table](#)<sup>p478</sup> elements  
**cellspacing** on [table](#)<sup>p478</sup> elements  
**frame** on [table](#)<sup>p478</sup> elements  
**height** on [table](#)<sup>p478</sup> elements  
**rules** on [table](#)<sup>p478</sup> elements  
**width** on [table](#)<sup>p478</sup> elements  
**align** on [tbody](#)<sup>p489</sup>, [thead](#)<sup>p490</sup>, and [tfoot](#)<sup>p491</sup> elements  
**char** on [tbody](#)<sup>p489</sup>, [thead](#)<sup>p490</sup>, and [tfoot](#)<sup>p491</sup> elements  
**charoff** on [tbody](#)<sup>p489</sup>, [thead](#)<sup>p490</sup>, and [tfoot](#)<sup>p491</sup> elements  
**height** on [thead](#)<sup>p490</sup>, [tbody](#)<sup>p489</sup>, and [tfoot](#)<sup>p491</sup> elements  
**valign** on [tbody](#)<sup>p489</sup>, [thead](#)<sup>p490</sup>, and [tfoot](#)<sup>p491</sup> elements  
**align** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**bgcolor** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**char** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**charoff** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**height** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**nowrap** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**valign** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**width** on [td](#)<sup>p493</sup> and [th](#)<sup>p495</sup> elements  
**align** on [tr](#)<sup>p492</sup> elements  
**bgcolor** on [tr](#)<sup>p492</sup> elements  
**char** on [tr](#)<sup>p492</sup> elements  
**charoff** on [tr](#)<sup>p492</sup> elements  
**height** on [tr](#)<sup>p492</sup> elements  
**valign** on [tr](#)<sup>p492</sup> elements  
**compact** on [ul](#)<sup>p239</sup> elements  
**type** on [ul](#)<sup>p239</sup> elements  
**background** on [body](#)<sup>p205</sup>, [table](#)<sup>p478</sup>, [thead](#)<sup>p490</sup>, [tbody](#)<sup>p489</sup>, [tfoot](#)<sup>p491</sup>, [tr](#)<sup>p492</sup>, [td](#)<sup>p493</sup>, and [th](#)<sup>p495</sup> elements

Use CSS instead.

## 16.3 Requirements for implementations <sup>§ p14</sup><sub>31</sub>

### 16.3.1 The **marquee** element <sup>§ p14</sup><sub>31</sub>

The [marquee](#)<sup>p1431</sup> element is a presentational element that animates content. CSS transitions and animations are a more appropriate mechanism. [\[CSSANIMATIONS\]](#)<sup>p1476</sup> [\[CSSTRANSITIONS\]](#)<sup>p1477</sup>

The [marquee](#)<sup>p1431</sup> element must implement the [HTMLMarqueeElement](#)<sup>p1431</sup> interface.

```

IDL [Exposed=Window]
interface HTMLMarqueeElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute DOMString behavior;
  [CEReactions] attribute DOMString bgColor;
  [CEReactions] attribute DOMString direction;

```

```

[CEReactions] attribute DOMString height;
[CEReactions] attribute unsigned long hspace;
[CEReactions] attribute long loop;
[CEReactions] attribute unsigned long scrollAmount;
[CEReactions] attribute unsigned long scrollDelay;
[CEReactions] attribute boolean trueSpeed;
[CEReactions] attribute unsigned long vspace;
[CEReactions] attribute DOMString width;

undefined start();
undefined stop();
};

```

A [marquee<sup>p1431</sup>](#) element can be **turned on** or **turned off**. When it is created, it is [turned on<sup>p1432</sup>](#).

When the **start()** method is called, the [marquee<sup>p1431</sup>](#) element must be [turned on<sup>p1432</sup>](#).

When the **stop()** method is called, the [marquee<sup>p1431</sup>](#) element must be [turned off<sup>p1432</sup>](#).

The **behavior** content attribute on [marquee<sup>p1431</sup>](#) elements is an [enumerated attribute<sup>p76</sup>](#) with the following keywords and states (all non-conforming):

Keyword	State
scroll	<b>scroll</b>
slide	<b>slide</b>
alternate	<b>alternate</b>

The attribute's [missing value default<sup>p76</sup>](#) and [invalid value default<sup>p76</sup>](#) are both the [scroll<sup>p1432</sup>](#) state.

The **direction** content attribute on [marquee<sup>p1431</sup>](#) elements is an [enumerated attribute<sup>p76</sup>](#) with the following keywords and states (all non-conforming):

Keyword	State
left	<b>left</b>
right	<b>right</b>
up	<b>up</b>
down	<b>down</b>

The attribute's [missing value default<sup>p76</sup>](#) and [invalid value default<sup>p76</sup>](#) are both the [left<sup>p1432</sup>](#) state.

The **trueSpeed** content attribute on [marquee<sup>p1431</sup>](#) elements is a [boolean attribute<sup>p75</sup>](#).

A [marquee<sup>p1431</sup>](#) element has a **marquee scroll interval**, which is obtained as follows:

1. If the element has a `scrollDelay` attribute, and parsing its value using the [rules for parsing non-negative integers<sup>p77</sup>](#) does not return an error, then let *delay* be the parsed value. Otherwise, let *delay* be 85.
2. If the element does not have a [trueSpeed<sup>p1431</sup>](#) attribute, and the *delay* value is less than 60, then let *delay* be 60 instead.
3. The [marquee scroll interval<sup>p1432</sup>](#) is *delay*, interpreted in milliseconds.

A [marquee<sup>p1431</sup>](#) element has a **marquee scroll distance**, which, if the element has a `scrollAmount` attribute, and parsing its value using the [rules for parsing non-negative integers<sup>p77</sup>](#) does not return an error, is the parsed value interpreted in [CSS pixels](#), and otherwise is 6 [CSS pixels](#).

A [marquee<sup>p1431</sup>](#) element has a **marquee loop count**, which, if the element has a **loop** attribute, and parsing its value using the [rules for parsing integers<sup>p76</sup>](#) does not return an error or a number less than 1, is the parsed value, and otherwise is  $-1$ .

The **loop** IDL attribute, on getting, must return the element's [marquee loop count<sup>p1433</sup>](#); and on setting, if the new value is different than the element's [marquee loop count<sup>p1433</sup>](#) and either greater than zero or equal to  $-1$ , must set the element's [loop<sup>p1433</sup>](#) content attribute (adding it if necessary) to the [valid integer<sup>p76</sup>](#) that represents the new value. (Other values are ignored.)

A [marquee<sup>p1431</sup>](#) element also has a **marquee current loop index**, which is zero when the element is created.

The rendering layer will occasionally **increment the marquee current loop index**, which must cause the following steps to be run:

1. If the [marquee loop count<sup>p1433</sup>](#) is  $-1$ , then return.
2. Increment the [marquee current loop index<sup>p1433</sup>](#) by one.
3. If the [marquee current loop index<sup>p1433</sup>](#) is now greater than or equal to the element's [marquee loop count<sup>p1433</sup>](#), [turn off<sup>p1432</sup>](#) the [marquee<sup>p1431</sup>](#) element.

The **behavior**, **direction**, **height**, **hspace**, **vspace**, and **width** IDL attributes must [reflect<sup>p104</sup>](#) the respective content attributes of the same name.

The **bgColor** IDL attribute must [reflect<sup>p104</sup>](#) the `bgcolor` content attribute.

The **scrollAmount** IDL attribute must [reflect<sup>p104</sup>](#) the `scrollamount` content attribute. The [default value<sup>p106</sup>](#) is 6.

The **scrollDelay** IDL attribute must [reflect<sup>p104</sup>](#) the `scrolldelay` content attribute. The [default value<sup>p106</sup>](#) is 85.

The **trueSpeed** IDL attribute must [reflect<sup>p104</sup>](#) the [truespeed<sup>p1432</sup>](#) content attribute.

### 16.3.2 Frames <sup>p14</sup><sub>33</sub>

The **frameset** element acts as [the body element<sup>p136</sup>](#) in documents that use frames.

The [frameset<sup>p1433</sup>](#) element must implement the [HTMLFrameSetElement<sup>p1433</sup>](#) interface.

```
IDL [Exposed=Window]
interface HTMLFrameSetElement : HTMLElement {
    [HTMLConstructor] constructor();

    [CEReactions] attribute DOMString cols;
    [CEReactions] attribute DOMString rows;
};
HTMLFrameSetElement includes WindowEventHandlers;
```

The **cols** and **rows** IDL attributes of the [frameset<sup>p1433</sup>](#) element must [reflect<sup>p104</sup>](#) the respective content attributes of the same name.

The [frameset<sup>p1433</sup>](#) element exposes as [event handler content attributes<sup>p1138</sup>](#) a number of the [event handlers<sup>p1136</sup>](#) of the [Window<sup>p922</sup>](#) object. It also mirrors their [event handler IDL attributes<sup>p1137</sup>](#).

The [event handlers<sup>p1136</sup>](#) of the [Window<sup>p922</sup>](#) object named by the [Window-reflecting body element event handler set<sup>p1145</sup>](#), exposed on the [frameset<sup>p1433</sup>](#) element, replace the generic [event handlers<sup>p1136</sup>](#) with the same names normally supported by [HTML elements<sup>p45</sup>](#).

The **frame** element has a [content navigable<sup>p991</sup>](#) similar to the [iframe<sup>p390</sup>](#) element, but rendered within a [frameset<sup>p1433</sup>](#) element.

The [frame<sup>p1433</sup>](#) [HTML element insertion steps<sup>p45</sup>](#), given *insertedNode*, are:

1. If *insertedNode* is not [in a document tree](#), then return.
2. If *insertedNode*'s [root's browsing context<sup>p999</sup>](#) is null, then return.

3. [Create a new child navigable](#)<sup>p992</sup> for *insertedNode*.
4. [Process the frame attributes](#)<sup>p1434</sup> for *insertedNode*, with [initialInsertion](#)<sup>p1434</sup> set to true.

The [frame](#)<sup>p1433</sup> [HTML element removing steps](#)<sup>p45</sup>, given *removedNode*, are to [destroy a child navigable](#)<sup>p995</sup> given *removedNode*.

Whenever a [frame](#)<sup>p1433</sup> element with a non-null [content navigable](#)<sup>p991</sup> has its `src` attribute set, changed, or removed, the user agent must [process the frame attributes](#)<sup>p1434</sup>.

To **process the frame attributes** for an element *element*, with an optional boolean *initialInsertion*:

1. Let *url* be the result of running the [shared attribute processing steps for iframe and frame elements](#)<sup>p394</sup> given *element* and *initialInsertion*.
2. If *url* is null, then return.
3. If *url* [matches about:blank](#)<sup>p96</sup> and *initialInsertion* is true, then:
  1. [Fire an event](#) named `load`<sup>p1471</sup> at *element*.
  2. Return.
4. [Navigate an iframe or frame](#)<sup>p394</sup> given *element*, *url*, and the empty string.

The [frame](#)<sup>p1433</sup> element [potentially delays the load event](#)<sup>p395</sup>.

The [frame](#)<sup>p1433</sup> element must implement the [HTMLFrameElement](#)<sup>p1434</sup> interface.

```
IDL
[Exposed=Window]
interface HTMLFrameElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute DOMString name;
  [CEReactions] attribute DOMString scrolling;
  [CEReactions] attribute USVString src;
  [CEReactions] attribute DOMString frameBorder;
  [CEReactions] attribute USVString longDesc;
  [CEReactions] attribute boolean noResize;
  readonly attribute Document? contentDocument;
  readonly attribute WindowProxy? contentWindow;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginHeight;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginWidth;
};
```

The **name**, **scrolling**, and **src** IDL attributes of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name. For the purposes of reflection, the [frame](#)<sup>p1433</sup> element's `src` content attribute is defined as containing a [URL](#).

The **frameBorder** IDL attribute of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the element's `frameborder` content attribute.

The **longDesc** IDL attribute of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the element's `longdesc` content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The **noResize** IDL attribute of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the element's `noresize` content attribute.

The **marginHeight** IDL attribute of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the element's `marginheight` content attribute.

The **marginWidth** IDL attribute of the [frame](#)<sup>p1433</sup> element must [reflect](#)<sup>p104</sup> the element's `marginwidth` content attribute.

The **contentDocument** getter steps are to return [this's content document](#)<sup>p992</sup>.

The **contentWindow** getter steps are to return [this's content window](#)<sup>p992</sup>.

### 16.3.3 Other elements, attributes and APIs <sup>p14</sup><sub>35</sub>

User agents must treat [acronym<sup>p1426</sup>](#) elements in a manner equivalent to [abbr<sup>p269</sup>](#) elements in terms of semantics and for purposes of rendering.

```
IDL partial interface HTMLAnchorElement {
  [CEReactions] attribute DOMString coords;
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString name;
  [CEReactions] attribute DOMString rev;
  [CEReactions] attribute DOMString shape;
};
```

The **coords**, **charset**, **name**, **rev**, and **shape** IDL attributes of the [a<sup>p257</sup>](#) element must [reflect<sup>p104</sup>](#) the respective content attributes of the same name.

```
IDL partial interface HTMLAreaElement {
  [CEReactions] attribute boolean noHref;
};
```

The **noHref** IDL attribute of the [area<sup>p471</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [nohref<sup>p1428</sup>](#) content attribute.

```
IDL partial interface HTMLBodyElement {
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString text;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString link;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString vLink;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString aLink;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
  [CEReactions] attribute DOMString background;
};
```

The **text** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [text<sup>p1430</sup>](#) content attribute.

The **link** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [link<sup>p1430</sup>](#) content attribute.

The **aLink** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [aLink<sup>p1430</sup>](#) content attribute.

The **vLink** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [vLink<sup>p1430</sup>](#) content attribute.

The **bgColor** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [bgColor<sup>p1430</sup>](#) content attribute.

The **background** IDL attribute of the [body<sup>p295</sup>](#) element must [reflect<sup>p104</sup>](#) the element's [background<sup>p1431</sup>](#) content attribute. (The [background<sup>p1431</sup>](#) content is *not* defined to contain a [URL](#), despite rules regarding its handling in the Rendering section above.)

```
IDL partial interface HTMLBRElement {
  [CEReactions] attribute DOMString clear;
};
```

The **clear** IDL attribute of the [br<sup>p299</sup>](#) element must [reflect<sup>p104</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLTableCaptionElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [caption<sup>p486</sup>](#) element must [reflect<sup>p104</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLTableColElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute DOMString vAlign;
  [CEReactions] attribute DOMString width;
};
```

The **align** and **width** IDL attributes of the [col](#)<sup>p488</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The **ch** IDL attribute of the [col](#)<sup>p488</sup> element must [reflect](#)<sup>p104</sup> the element's [char](#)<sup>p1430</sup> content attribute.

The **chOff** IDL attribute of the [col](#)<sup>p488</sup> element must [reflect](#)<sup>p104</sup> the element's [charoff](#)<sup>p1430</sup> content attribute.

The **vAlign** IDL attribute of the [col](#)<sup>p488</sup> element must [reflect](#)<sup>p104</sup> the element's [valign](#)<sup>p1430</sup> content attribute.

User agents must treat [dir](#)<sup>p1426</sup> elements in a manner equivalent to [ul](#)<sup>p239</sup> elements in terms of semantics and for purposes of rendering.

The [dir](#)<sup>p1426</sup> element must implement the [HTMLDirectoryElement](#)<sup>p1436</sup> interface.

```
IDL [Exposed=Window]
interface HTMLDirectoryElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [dir](#)<sup>p1426</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLDivElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the [div](#)<sup>p256</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLDListElement {
  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [dl](#)<sup>p244</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLEmbedElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString name;
};
```

The **name** and **align** IDL attributes of the [embed](#)<sup>p399</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The [font](#)<sup>p1427</sup> element must implement the [HTMLFontElement](#)<sup>p1436</sup> interface.

```
IDL [Exposed=Window]
interface HTMLFontElement : HTMLElement {
  [HTMLConstructor] constructor();
```

```

[CEReactions] attribute [LegacyNullToEmptyString] DOMString color;
[CEReactions] attribute DOMString face;
[CEReactions] attribute DOMString size;
};

```

The **color**, **face**, and **size** IDL attributes of the **font**<sup>p1427</sup> element must **reflect**<sup>p104</sup> the respective content attributes of the same name.

```

IDL partial interface HTMLHeadingElement {
  [CEReactions] attribute DOMString align;
};

```

The **align** IDL attribute of the **h1**<sup>p216</sup>–**h6**<sup>p216</sup> elements must **reflect**<sup>p104</sup> the content attribute of the same name.

#### Note

The **profile** IDL attribute on **head**<sup>p173</sup> elements (with the **HTMLHeadElement**<sup>p173</sup> interface) is intentionally omitted. Unless so required by [another applicable specification](#)<sup>p73</sup>, implementations would therefore not support this attribute. (It is mentioned here as it was defined in a previous version of DOM.)

```

IDL partial interface HTMLHRElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString color;
  [CEReactions] attribute boolean noShade;
  [CEReactions] attribute DOMString size;
  [CEReactions] attribute DOMString width;
};

```

The **align**, **color**, **size**, and **width** IDL attributes of the **hr**<sup>p231</sup> element must **reflect**<sup>p104</sup> the respective content attributes of the same name.

The **noShade** IDL attribute of the **hr**<sup>p231</sup> element must **reflect**<sup>p104</sup> the element's **noshade**<sup>p1430</sup> content attribute.

```

IDL partial interface HTMLHtmlElement {
  [CEReactions] attribute DOMString version;
};

```

The **version** IDL attribute of the **html**<sup>p172</sup> element must **reflect**<sup>p104</sup> the content attribute of the same name.

```

IDL partial interface HTMLIFrameElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString scrolling;
  [CEReactions] attribute DOMString frameBorder;
  [CEReactions] attribute USVString longDesc;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginHeight;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString marginWidth;
};

```

The **align** and **scrolling** IDL attributes of the **iframe**<sup>p390</sup> element must **reflect**<sup>p104</sup> the respective content attributes of the same name.

The **frameBorder** IDL attribute of the **iframe**<sup>p390</sup> element must **reflect**<sup>p104</sup> the element's **frameborder**<sup>p1430</sup> content attribute.

The **longDesc** IDL attribute of the **iframe**<sup>p390</sup> element must **reflect**<sup>p104</sup> the element's **longdesc**<sup>p1428</sup> content attribute, which for the purposes of reflection is defined as containing a **URL**.

The **marginHeight** IDL attribute of the **iframe**<sup>p390</sup> element must **reflect**<sup>p104</sup> the element's **marginheight**<sup>p1430</sup> content attribute.

The **marginWidth** IDL attribute of the **iframe**<sup>p390</sup> element must **reflect**<sup>p104</sup> the element's **marginwidth**<sup>p1430</sup> content attribute.

```
IDL partial interface HTMLImageElement {
  [CEReactions] attribute DOMString name;
  [CEReactions] attribute USVString lowsrc;
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute unsigned long hspace;
  [CEReactions] attribute unsigned long vspace;
  [CEReactions] attribute USVString longDesc;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString border;
};
```

The **name**, **align**, **border**, **hspace**, and **vspace** IDL attributes of the **img**<sup>p346</sup> element must **reflect**<sup>p104</sup> the respective content attributes of the same name.

The **longDesc** IDL attribute of the **img**<sup>p346</sup> element must **reflect**<sup>p104</sup> the element's **longdesc**<sup>p1428</sup> content attribute, which for the purposes of reflection is defined as containing a **URL**.

The **lowsrc** IDL attribute of the **img**<sup>p346</sup> element must **reflect**<sup>p104</sup> the element's **lowsrc**<sup>p1428</sup> content attribute, which for the purposes of reflection is defined as containing a **URL**.

```
IDL partial interface HTMLInputElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString useMap;
};
```

The **align** IDL attribute of the **input**<sup>p520</sup> element must **reflect**<sup>p104</sup> the content attribute of the same name.

The **useMap** IDL attribute of the **input**<sup>p520</sup> element must **reflect**<sup>p104</sup> the element's **usemap**<sup>p1428</sup> content attribute.

```
IDL partial interface HTMLLegendElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the **legend**<sup>p596</sup> element must **reflect**<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLLIElement {
  [CEReactions] attribute DOMString type;
};
```

The **type** IDL attribute of the **li**<sup>p241</sup> element must **reflect**<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLLinkElement {
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString rev;
  [CEReactions] attribute DOMString target;
};
```

The **charset**, **rev**, and **target** IDL attributes of the **link**<sup>p177</sup> element must **reflect**<sup>p104</sup> the respective content attributes of the same name.

User agents must treat [listing<sup>p1426</sup>](#) elements in a manner equivalent to [pre<sup>p233</sup>](#) elements in terms of semantics and for purposes of rendering.

```
IDL partial interface HTMLMenuElement {
  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the [menu<sup>p240</sup>](#) element must [reflect<sup>p104</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLMetaElement {
  [CEReactions] attribute DOMString scheme;
};
```

User agents may treat the [scheme<sup>p1428</sup>](#) content attribute on the [meta<sup>p189</sup>](#) element as an extension of the element's [name<sup>p190</sup>](#) content attribute when processing a [meta<sup>p189</sup>](#) element with a [name<sup>p190</sup>](#) attribute whose value is one that the user agent recognizes as supporting the [scheme<sup>p1428</sup>](#) attribute.

User agents are encouraged to ignore the [scheme<sup>p1428</sup>](#) attribute and instead process the value given to the metadata name as if it had been specified for each expected value of the [scheme<sup>p1428</sup>](#) attribute.

#### Example

For example, if the user agent acts on [meta<sup>p189</sup>](#) elements with [name<sup>p190</sup>](#) attributes having the value "eGMS.subject.keyword", and knows that the [scheme<sup>p1428</sup>](#) attribute is used with this metadata name, then it could take the [scheme<sup>p1428</sup>](#) attribute into account, acting as if it was an extension of the [name<sup>p190</sup>](#) attribute. Thus the following two [meta<sup>p189</sup>](#) elements could be treated as two elements giving values for two different metadata names, one consisting of a combination of "eGMS.subject.keyword" and "LGCL", and the other consisting of a combination of "eGMS.subject.keyword" and "ORLY":

```
<!-- this markup is invalid -->
<meta name="eGMS.subject.keyword" scheme="LGCL" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" scheme="ORLY" content="Mah car: kthxbye">
```

The suggested processing of this markup, however, would be equivalent to the following:

```
<meta name="eGMS.subject.keyword" content="Abandoned vehicles">
<meta name="eGMS.subject.keyword" content="Mah car: kthxbye">
```

The **scheme** IDL attribute of the [meta<sup>p189</sup>](#) element must [reflect<sup>p104</sup>](#) the content attribute of the same name.

```
IDL partial interface HTMLObjectElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString archive;
  [CEReactions] attribute DOMString code;
  [CEReactions] attribute boolean declare;
  [CEReactions] attribute unsigned long hspace;
  [CEReactions] attribute DOMString standby;
  [CEReactions] attribute unsigned long vspace;
  [CEReactions] attribute DOMString codeBase;
  [CEReactions] attribute DOMString codeType;
  [CEReactions] attribute DOMString useMap;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString border;
};
```

The **align**, **archive**, **border**, **code**, **declare**, **hspace**, **standby**, and **vspace** IDL attributes of the [object<sup>p402</sup>](#) element must [reflect<sup>p104</sup>](#) the respective content attributes of the same name.

The **codeBase** IDL attribute of the **object**<sup>p402</sup> element must [reflect](#)<sup>p104</sup> the element's **codebase**<sup>p1429</sup> content attribute, which for the purposes of reflection is defined as containing a [URL](#).

The **codeType** IDL attribute of the **object**<sup>p402</sup> element must [reflect](#)<sup>p104</sup> the element's **codetype**<sup>p1429</sup> content attribute.

The **useMap** IDL attribute must [reflect](#)<sup>p104</sup> the **usemap**<sup>p473</sup> content attribute.

```
IDL partial interface HTMLQListElement {
  [CEReactions] attribute boolean compact;
};
```

The **compact** IDL attribute of the **ol**<sup>p238</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLParagraphElement {
  [CEReactions] attribute DOMString align;
};
```

The **align** IDL attribute of the **p**<sup>p229</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

The **param**<sup>p1426</sup> element must implement the **HTMLParamElement**<sup>p1440</sup> interface.

```
IDL [Exposed=Window]
interface HTMLParamElement : HTMLElement {
  [HTMLConstructor] constructor();

  [CEReactions] attribute DOMString name;
  [CEReactions] attribute DOMString value;
  [CEReactions] attribute DOMString type;
  [CEReactions] attribute DOMString valueType;
};
```

The **name**, **value**, and **type** IDL attributes of the **param**<sup>p1426</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The **valueType** IDL attribute of the **param**<sup>p1426</sup> element must [reflect](#)<sup>p104</sup> the element's **valuetype** content attribute.

User agents must treat **plaintext**<sup>p1426</sup> elements in a manner equivalent to **pre**<sup>p233</sup> elements in terms of semantics and for purposes of rendering. (The parser has special behavior for this element, though.)

```
IDL partial interface HTMLPreElement {
  [CEReactions] attribute long width;
};
```

The **width** IDL attribute of the **pre**<sup>p233</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

```
IDL partial interface HTMLStyleElement {
  [CEReactions] attribute DOMString type;
};
```

The **type** IDL attribute of the **style**<sup>p200</sup> element must [reflect](#)<sup>p104</sup> the element's **type**<sup>p1429</sup> content attribute.

```
IDL partial interface HTMLScriptElement {
  [CEReactions] attribute DOMString charset;
  [CEReactions] attribute DOMString event;
  [CEReactions] attribute DOMString htmlFor;
};
```

The **charset** and **event** IDL attributes of the **script**<sup>p652</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The **htmlFor** IDL attribute of the **script**<sup>p652</sup> element must [reflect](#)<sup>p104</sup> the element's **for**<sup>p1429</sup> content attribute.

```
IDL partial interface HTMLTableElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString border;
  [CEReactions] attribute DOMString frame;
  [CEReactions] attribute DOMString rules;
  [CEReactions] attribute DOMString summary;
  [CEReactions] attribute DOMString width;

  [CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString cellPadding;
  [CEReactions] attribute [LegacyNullToEmptyString] DOMString cellSpacing;
};
```

The **align**, **border**, **frame**, **summary**, **rules**, and **width**, IDL attributes of the **table**<sup>p478</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The **bgColor** IDL attribute of the **table**<sup>p478</sup> element must [reflect](#)<sup>p104</sup> the element's **bgcolor**<sup>p1431</sup> content attribute.

The **cellPadding** IDL attribute of the **table**<sup>p478</sup> element must [reflect](#)<sup>p104</sup> the element's **cellpadding**<sup>p1431</sup> content attribute.

The **cellSpacing** IDL attribute of the **table**<sup>p478</sup> element must [reflect](#)<sup>p104</sup> the element's **cellspacing**<sup>p1431</sup> content attribute.

```
IDL partial interface HTMLTableSectionElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
  [CEReactions] attribute DOMString vAlign;
};
```

The **align** IDL attribute of the **tbody**<sup>p489</sup>, **thead**<sup>p490</sup>, and **tfoot**<sup>p491</sup> elements must [reflect](#)<sup>p104</sup> the content attribute of the same name.

The **ch** IDL attribute of the **tbody**<sup>p489</sup>, **thead**<sup>p490</sup>, and **tfoot**<sup>p491</sup> elements must [reflect](#)<sup>p104</sup> the elements' **char**<sup>p1431</sup> content attributes.

The **chOff** IDL attribute of the **tbody**<sup>p489</sup>, **thead**<sup>p490</sup>, and **tfoot**<sup>p491</sup> elements must [reflect](#)<sup>p104</sup> the elements' **charoff**<sup>p1431</sup> content attributes.

The **vAlign** IDL attribute of the **tbody**<sup>p489</sup>, **thead**<sup>p490</sup>, and **tfoot**<sup>p491</sup> element must [reflect](#)<sup>p104</sup> the elements' **valign**<sup>p1431</sup> content attributes.

```
IDL partial interface HTMLTableCellElement {
  [CEReactions] attribute DOMString align;
  [CEReactions] attribute DOMString axis;
  [CEReactions] attribute DOMString height;
  [CEReactions] attribute DOMString width;

  [CEReactions] attribute DOMString ch;
  [CEReactions] attribute DOMString chOff;
};
```

```

[CEReactions] attribute boolean nowrap;
[CEReactions] attribute DOMString vAlign;

[CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
};

```

The **align**, **axis**, **height**, and **width** IDL attributes of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

The **ch** IDL attribute of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the elements' **char**<sup>p1431</sup> content attributes.

The **chOff** IDL attribute of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the elements' **charoff**<sup>p1431</sup> content attributes.

The **nowrap** IDL attribute of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the elements' **nowrap**<sup>p1431</sup> content attributes.

The **vAlign** IDL attribute of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the elements' **valign**<sup>p1431</sup> content attributes.

The **bgColor** IDL attribute of the **td**<sup>p493</sup> and **th**<sup>p495</sup> elements must [reflect](#)<sup>p104</sup> the elements' **bgcolor**<sup>p1431</sup> content attributes.

```

IDL partial interface HTMLTableRowElement {
[CEReactions] attribute DOMString align;
[CEReactions] attribute DOMString ch;
[CEReactions] attribute DOMString chOff;
[CEReactions] attribute DOMString vAlign;

[CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;
};

```

The **align** IDL attribute of the **tr**<sup>p492</sup> element must [reflect](#)<sup>p104</sup> the content attribute of the same name.

The **ch** IDL attribute of the **tr**<sup>p492</sup> element must [reflect](#)<sup>p104</sup> the element's **char**<sup>p1431</sup> content attribute.

The **chOff** IDL attribute of the **tr**<sup>p492</sup> element must [reflect](#)<sup>p104</sup> the element's **charoff**<sup>p1431</sup> content attribute.

The **vAlign** IDL attribute of the **tr**<sup>p492</sup> element must [reflect](#)<sup>p104</sup> the element's **valign**<sup>p1431</sup> content attribute.

The **bgColor** IDL attribute of the **tr**<sup>p492</sup> element must [reflect](#)<sup>p104</sup> the element's **bgcolor**<sup>p1431</sup> content attribute.

```

IDL partial interface HTMLULListElement {
[CEReactions] attribute boolean compact;
[CEReactions] attribute DOMString type;
};

```

The **compact** and **type** IDL attributes of the **ul**<sup>p239</sup> element must [reflect](#)<sup>p104</sup> the respective content attributes of the same name.

User agents must treat **xmp**<sup>p1427</sup> elements in a manner equivalent to **pre**<sup>p233</sup> elements in terms of semantics and for purposes of rendering. (The parser has special behavior for this element though.)

```

IDL partial interface Document {
[CEReactions] attribute [LegacyNullToEmptyString] DOMString fgColor;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString linkColor;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString vlinkColor;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString alinkColor;
[CEReactions] attribute [LegacyNullToEmptyString] DOMString bgColor;

[SameObject] readonly attribute HTMLCollection anchors;
};

```

```

[SameObject] readonly attribute HTMLCollection applets;

undefined clear();
undefined captureEvents();
undefined releaseEvents();

[SameObject] readonly attribute HTMLAllCollection all;
};

```

The attributes of the [Document](#)<sup>p130</sup> object listed in the first column of the following table must [reflect](#)<sup>p104</sup> the content attribute on [the body element](#)<sup>p136</sup> with the name given in the corresponding cell in the second column on the same row, if [the body element](#)<sup>p136</sup> is a [body](#)<sup>p205</sup> element (as opposed to a [frameset](#)<sup>p1433</sup> element). When there is no [body element](#)<sup>p136</sup> or if it is a [frameset](#)<sup>p1433</sup> element, the attributes must instead return the empty string on getting and do nothing on setting.

IDL attribute	Content attribute
<a href="#">fgColor</a>	<a href="#">text</a> <sup>p1430</sup>
<a href="#">linkColor</a>	<a href="#">link</a> <sup>p1430</sup>
<a href="#">vlinkColor</a>	<a href="#">vlink</a> <sup>p1430</sup>
<a href="#">alinkColor</a>	<a href="#">alink</a> <sup>p1430</sup>
<a href="#">bgColor</a>	<a href="#">bgcolor</a> <sup>p1430</sup>

The [anchors](#) attribute must return an [HTMLCollection](#) rooted at the [Document](#)<sup>p130</sup> node, whose filter matches only [a](#)<sup>p257</sup> elements with [name](#)<sup>p1427</sup> attributes.

The [applets](#) attribute must return an [HTMLCollection](#) rooted at the [Document](#)<sup>p130</sup> node, whose filter matches nothing. (It exists for historical reasons.)

The [clear\(\)](#), [captureEvents\(\)](#), and [releaseEvents\(\)](#) methods must do nothing.

The [all](#) attribute must return an [HTMLAllCollection](#)<sup>p111</sup> rooted at the [Document](#)<sup>p130</sup> node, whose filter matches all elements.

```

IDL partial interface Window {
    undefined captureEvents();
    undefined releaseEvents();

    [Replaceable, SameObject] readonly attribute External external;
};

```

The [captureEvents\(\)](#) and [releaseEvents\(\)](#) methods must do nothing.

The [external](#) attribute of the [Window](#)<sup>p922</sup> interface must return an instance of the [External](#)<sup>p1443</sup> interface:

```

IDL [Exposed=Window]
interface External {
    undefined AddSearchProvider();
    undefined IsSearchProviderInstalled();
};

```

The [AddSearchProvider\(\)](#) and [IsSearchProviderInstalled\(\)](#) methods must do nothing.

## 17 IANA considerations <sup>p14</sup><sub>44</sub>

### 17.1 text/html <sup>p14</sup><sub>44</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

#### Type name:

text

#### Subtype name:

html

#### Required parameters:

No required parameters

#### Optional parameters:

##### charset

The `charset` parameter may be provided to specify the [document's character encoding](#), overriding any [character encoding declarations](#)<sup>p199</sup> in the document other than a Byte Order Mark (BOM). The parameter's value must be an [ASCII case-insensitive](#) match for the string "utf-8". [\[ENCODING\]](#)<sup>p1478</sup>

#### Encoding considerations:

8bit (see the section on [character encoding declarations](#)<sup>p199</sup>)

#### Security considerations:

Entire novels have been written about the security considerations that apply to HTML documents. Many are listed in this document, to which the reader is referred for more details. Some general concerns bear mentioning here, however:

HTML is scripted language, and has a large number of APIs (some of which are described in this document). Script can expose the user to potential risks of information leakage, credential leakage, cross-site scripting attacks, cross-site request forgeries, and a host of other problems. While the designs in this specification are intended to be safe if implemented correctly, a full implementation is a massive undertaking and, as with any software, user agents are likely to have security bugs.

Even without scripting, there are specific features in HTML which, for historical reasons, are required for broad compatibility with legacy content but that expose the user to unfortunate security problems. In particular, the `img`<sup>p346</sup> element can be used in conjunction with some other features as a way to effect a port scan from the user's location on the Internet. This can expose local network topologies that the attacker would otherwise not be able to determine.

HTML relies on a compartmentalization scheme sometimes known as the *same-origin policy*. An [origin](#)<sup>p898</sup> in most cases consists of all the pages served from the same host, on the same port, using the same protocol.

It is critical, therefore, to ensure that any untrusted content that forms part of a site be hosted on a different [origin](#)<sup>p898</sup> than any sensitive content on that site. Untrusted content can easily spoof any other page on the same origin, read data from that origin, cause scripts in that origin to execute, submit forms to and from that origin even if they are protected from cross-site request forgery attacks by unique tokens, and make use of any third-party resources exposed to or rights granted to that origin.

#### Interoperability considerations:

Rules for processing both conforming and non-conforming content are defined in this specification.

#### Published specification:

This document is the relevant specification. Labeling a resource with the `text/html`<sup>p1444</sup> type asserts that the resource is an [HTML document](#) using [the HTML syntax](#)<sup>p1259</sup>.

#### Applications that use this media type:

Web browsers, tools for processing web content, HTML authoring tools, search engines, validators.

#### Additional information:

##### Magic number(s):

No sequence of bytes can uniquely identify an HTML document. More information on detecting HTML documents is available in *MIME Sniffing*. [\[MIMESNIFF\]](#)<sup>p1480</sup>

##### File extension(s):

"html" and "htm" are commonly, but certainly not exclusively, used as the extension for HTML documents.

**Macintosh file type code(s):**

TEXT

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [text/html](#)<sup>p1444</sup> resources either refer to the [indicated part](#)<sup>p1054</sup> of the corresponding [Document](#)<sup>p130</sup>, or provide state information for in-page scripts.

## 17.2 [multipart/x-mixed-replace](#) §<sup>p14</sup><sub>45</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

multipart

**Subtype name:**

x-mixed-replace

**Required parameters:**

- boundary (defined in RFC2046) [\[RFC2046\]](#)<sup>p1481</sup>

**Optional parameters:**

No optional parameters.

**Encoding considerations:**

binary

**Security considerations:**

Subresources of a [multipart/x-mixed-replace](#)<sup>p1445</sup> resource can be of any type, including types with non-trivial security implications such as [text/html](#)<sup>p1444</sup>.

**Interoperability considerations:**

None.

**Published specification:**

This specification describes processing rules for web browsers. Conformance requirements for generating resources with this type are the same as for [multipart/mixed](#)<sup>p1474</sup>. [\[RFC2046\]](#)<sup>p1481</sup>

**Applications that use this media type:**

This type is intended to be used in resources generated by web servers, for consumption by web browsers.

**Additional information:****Magic number(s):**

No sequence of bytes can uniquely identify a [multipart/x-mixed-replace](#)<sup>p1445</sup> resource.

**File extension(s):**

No specific file extensions are recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [multipart/x-mixed-replace](#)<sup>p1445</sup> resources apply to each body part as defined by the type used by that body part.

## 17.3 [application/xhtml+xml](#) §<sup>p14</sup><sub>46</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

xhtml+xml

**Required parameters:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Optional parameters:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Encoding considerations:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Security considerations:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Interoperability considerations:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Published specification:**

Labeling a resource with the [application/xhtml+xml](#)<sup>p1446</sup> type asserts that the resource is an XML document that likely has a [document element](#) from the [HTML namespace](#). Thus, the relevant specifications are *XML*, *Namespaces in XML*, and this specification. [\[XML\]](#)<sup>p1484</sup> [\[XMLNS\]](#)<sup>p1484</sup>

**Applications that use this media type:**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**Additional information:****Magic number(s):**

Same as for [application/xml](#)<sup>p1473</sup> [\[RFC7303\]](#)<sup>p1482</sup>

**File extension(s):**

"xhtml" and "xht" are sometimes used as extensions for XML resources that have a [document element](#) from the [HTML namespace](#).

**Macintosh file type code(s):**

TEXT

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [application/xhtml+xml](#)<sup>p1446</sup> resources have the same semantics as with any [XML MIME type](#). [\[RFC7303\]](#)<sup>p1482</sup>

## 17.4 text/ping §<sup>p14</sup><sub>47</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

text

**Subtype name:**

ping

**Required parameters:**

No parameters

**Optional parameters:**

**charset**

The **charset** parameter may be provided. The parameter's value must be "utf-8". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

**Encoding considerations:**

Not applicable.

**Security considerations:**

If used exclusively in the fashion described in the context of [hyperlink auditing](#)<sup>p312</sup>, this type introduces no new security concerns.

**Interoperability considerations:**

Rules applicable to this type are defined in this specification.

**Published specification:**

This document is the relevant specification.

**Applications that use this media type:**

Web browsers.

**Additional information:****Magic number(s):**

[text/ping](#)<sup>p1447</sup> resources always consist of the four bytes 0x50 0x49 0x4E 0x47 (`PING`).

**File extension(s):**

No specific file extension is recommended for this type.

**Macintosh file type code(s):**

No specific Macintosh file type codes are recommended for this type.

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

Only intended for use with HTTP POST requests generated as part of a web browser's processing of the [ping](#)<sup>p383</sup> attribute.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) have no meaning with [text/ping](#)<sup>p1447</sup> resources.

## 17.5 [application/microdata+json](#) §<sup>p14</sup><sub>48</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

**Type name:**

application

**Subtype name:**

microdata+json

**Required parameters:**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Optional parameters:**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Encoding considerations:**

8bit (always UTF-8)

**Security considerations:**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Interoperability considerations:**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Published specification:**

Labeling a resource with the [application/microdata+json](#)<sup>p1448</sup> type asserts that the resource is a JSON text that consists of an object with a single entry called "items" consisting of an array of entries, each of which consists of an object with an entry called "id" whose value is a string, an entry called "type" whose value is another string, and an entry called "properties" whose value is an object whose entries each have a value consisting of an array of either objects or strings, the objects being of the same form as the objects in the aforementioned "items" entry. Thus, the relevant specifications are *JSON* and this specification. [\[JSON\]](#)<sup>p1479</sup>

**Applications that use this media type:**

Applications that transfer data intended for use with HTML's microdata feature, especially in the context of drag-and-drop, are the primary application class for this type.

**Additional information:****Magic number(s):**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**File extension(s):**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Macintosh file type code(s):**

Same as for [application/json](#)<sup>p1473</sup> [\[JSON\]](#)<sup>p1479</sup>

**Person & email address to contact for further information:**

Ian Hickson <ian@hixie.ch>

**Intended usage:**

Common

**Restrictions on usage:**

No restrictions apply.

**Author:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) used with [application/microdata+json](#)<sup>p1448</sup> resources have the same semantics as when used with [application/json](#)<sup>p1473</sup> (namely, at the time of writing, no semantics at all). [\[JSON\]](#)<sup>p1479</sup>

## 17.6 text/event-stream §<sup>p14</sup><sub>49</sub>

This registration is for community review and will be submitted to the IESG for review, approval, and registration with IANA.

### Type name:

text

### Subtype name:

event-stream

### Required parameters:

No parameters

### Optional parameters:

charset

The `charset` parameter may be provided. The parameter's value must be "utf-8". This parameter serves no purpose; it is only allowed for compatibility with legacy servers.

### Encoding considerations:

8bit (always UTF-8)

### Security considerations:

An event stream from an origin distinct from the origin of the content consuming the event stream can result in information leakage. To avoid this, user agents are required to apply CORS semantics. [\[FETCH\]](#)<sup>p1478</sup>

Event streams can overwhelm a user agent; a user agent is expected to apply suitable restrictions to avoid depleting local resources because of an overabundance of information from an event stream.

Servers can be overwhelmed if a situation develops in which the server is causing clients to reconnect rapidly. Servers should use a 5xx status code to indicate capacity problems, as this will prevent conforming clients from reconnecting automatically.

### Interoperability considerations:

Rules for processing both conforming and non-conforming content are defined in this specification.

### Published specification:

This document is the relevant specification.

### Applications that use this media type:

Web browsers and tools using web services.

### Additional information:

#### Magic number(s):

No sequence of bytes can uniquely identify an event stream.

#### File extension(s):

No specific file extensions are recommended for this type.

#### Macintosh file type code(s):

No specific Macintosh file type codes are recommended for this type.

### Person & email address to contact for further information:

Ian Hickson <ian@hixie.ch>

### Intended usage:

Common

### Restrictions on usage:

This format is only expected to be used by dynamic open-ended streams served using HTTP or a similar protocol. Finite resources are not expected to be labeled with this type.

### Author:

Ian Hickson <ian@hixie.ch>

**Change controller:**

W3C

[Fragments](#) have no meaning with [text/event-stream](#)<sup>p1449</sup> resources.

## 17.7 **web+ scheme prefix** §<sup>p14</sup><sub>50</sub>

This section describes a convention for use with the IANA URI scheme registry. It does not itself register a specific scheme.

[\[RFC7595\]](#)<sup>p1481</sup>

**Scheme name:**

Schemes starting with the four characters "web+" followed by one or more letters in the range a-z.

**Status:**

Permanent

**Scheme syntax:**

Scheme-specific.

**Scheme semantics:**

Scheme-specific.

**Encoding considerations:**

All "web+" schemes should use UTF-8 encodings where relevant.

**Applications/protocols that use this scheme name:**

Scheme-specific.

**Interoperability considerations:**

The scheme is expected to be used in the context of web applications.

**Security considerations:**

Any web page is able to register a handler for all "web+" schemes. As such, these schemes must not be used for features intended to be core platform features (e.g., HTTP). Similarly, such schemes must not store confidential information in their URLs, such as usernames, passwords, personal information, or confidential project names.

**Contact:**

Ian Hickson <ian@hixie.ch>

**Change controller:**

Ian Hickson <ian@hixie.ch>

An asterisk (\*) in a cell indicates that the actual rules are more complicated than indicated in the table above.

† Categories in the "Parents" column refer to parents that list the given categories in their content model, not to elements that themselves are in those categories. For example, the [a](#)<sup>p257</sup> element's "Parents" column says "phrasing", so any element whose content model contains the "phrasing" category could be a parent of an [a](#)<sup>p257</sup> element. Since the "flow" category includes all the "phrasing" elements, that means the [th](#)<sup>p495</sup> element could be a parent to an [a](#)<sup>p257</sup> element.

Element content categories §<sup>p14</sup>

## Attributes <sup>p14</sup> 58

This section is non-normative.

List of attributes (excluding event handler content attributes)

Attribute	Element(s)	Description	Value
abbr	<a href="#">th</a> <sup>p495</sup>	Alternative label to use for the header cell when referencing the	<a href="#">Text</a> <sup>p147</sup> *

Attribute	Element(s)	Description	Value
		cell in other contexts	
accept	<a href="#">input</a> <sup>p544</sup>	Hint for expected file type in <a href="#">file upload controls</a> <sup>p544</sup>	<a href="#">Set of comma-separated tokens</a> <sup>p95</sup> * consisting of <a href="#">valid MIME type strings with no parameters</a> or audio/*, video/*, or image/*
accept-charset	<a href="#">form</a> <sup>p515</sup>	Character encodings to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">ASCII case-insensitive</a> match for "UTF-8"
accesskey	<a href="#">HTML elements</a> <sup>p851</sup>	Keyboard shortcut to activate or focus element	<a href="#">Ordered set of unique space-separated tokens</a> <sup>p95</sup> , none of which are <a href="#">identical to</a> another, each consisting of one code point in length
action	<a href="#">form</a> <sup>p602</sup>	<a href="#">URL</a> to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p96</sup>
allow	<a href="#">iframe</a> <sup>p397</sup>	<a href="#">Permissions policy</a> to be applied to the <a href="#">iframe</a> <sup>p390</sup> 's contents	<a href="#">Serialized permissions policy</a>
allowfullscreen	<a href="#">iframe</a> <sup>p397</sup>	Whether to allow the <a href="#">iframe</a> <sup>p390</sup> 's contents to use <a href="#">requestFullscreen()</a>	<a href="#">Boolean attribute</a> <sup>p75</sup>
alpha	<a href="#">input</a> <sup>p541</sup>	Allow the color's alpha component to be set	<a href="#">Boolean attribute</a> <sup>p75</sup>
alt	<a href="#">area</a> <sup>p472</sup> ; <a href="#">img</a> <sup>p347</sup> ; <a href="#">input</a> <sup>p548</sup>	Replacement text for use when images are not available	<a href="#">Text</a> <sup>p147</sup> *
as	<a href="#">link</a> <sup>p181</sup>	<a href="#">Potential destination</a> for a preload request (for <a href="#">rel</a> <sup>p178</sup> ="preload <sup>p328</sup> " and <a href="#">rel</a> <sup>p178</sup> ="modulepreload <sup>p323</sup> ")	<a href="#">Potential destination</a> , for <a href="#">rel</a> <sup>p178</sup> ="preload <sup>p328</sup> "; <a href="#">script-like destination</a> , for <a href="#">rel</a> <sup>p178</sup> ="modulepreload <sup>p323</sup> "
async	<a href="#">script</a> <sup>p654</sup>	Execute script when available, without blocking while fetching	<a href="#">Boolean attribute</a> <sup>p75</sup>
autocapitalize	<a href="#">HTML elements</a> <sup>p859</sup>	Recommended autocapitalization behavior (for supported input methods)	"on <sup>p859</sup> "; "off <sup>p859</sup> "; "none <sup>p859</sup> "; "sentences <sup>p859</sup> "; "words <sup>p859</sup> "; "characters <sup>p859</sup> "
autocomplete	<a href="#">form</a> <sup>p515</sup>	Default setting for autofill feature for controls in the form	"on"; "off"
autocomplete	<a href="#">input</a> <sup>p604</sup> ; <a href="#">select</a> <sup>p604</sup> ; <a href="#">textarea</a> <sup>p604</sup>	Hint for form autofill feature	<a href="#">Autofill field</a> <sup>p606</sup> name and related tokens*
autocorrect	<a href="#">HTML elements</a> <sup>p860</sup>	Recommended autocorrection behavior (for supported input methods)	"on <sup>p860</sup> "; "off <sup>p860</sup> "
autofocus	<a href="#">HTML elements</a> <sup>p848</sup>	Automatically focus the element when the page is loaded	<a href="#">Boolean attribute</a> <sup>p75</sup>
autoplay	<a href="#">audio</a> <sup>p435</sup> ; <a href="#">video</a> <sup>p435</sup>	Hint that the <a href="#">media resource</a> <sup>p415</sup> can be started automatically when the page is loaded	<a href="#">Boolean attribute</a> <sup>p75</sup>
blocking	<a href="#">link</a> <sup>p181</sup> ; <a href="#">script</a> <sup>p655</sup> ; <a href="#">style</a> <sup>p201</sup>	Whether the element is <a href="#">potentially render-blocking</a> <sup>p103</sup>	<a href="#">Unordered set of unique space-separated tokens</a> <sup>p95</sup> *
charset	<a href="#">meta</a> <sup>p190</sup>	<a href="#">Character encoding declaration</a> <sup>p199</sup>	"utf-8"
checked	<a href="#">input</a> <sup>p525</sup>	Whether the control is checked	<a href="#">Boolean attribute</a> <sup>p75</sup>
cite	<a href="#">blockquote</a> <sup>p235</sup> ; <a href="#">del</a> <sup>p339</sup> ; <a href="#">ins</a> <sup>p339</sup> ; <a href="#">q</a> <sup>p267</sup>	Link to the source of the quotation or more information about the edit	<a href="#">Valid URL potentially surrounded by spaces</a> <sup>p96</sup>
class	<a href="#">HTML elements</a> <sup>p154</sup>	Classes to which the element belongs	<a href="#">Set of space-separated tokens</a> <sup>p94</sup>
color	<a href="#">link</a> <sup>p181</sup>	Color to use when customizing a site's icon (for <a href="#">rel</a> <sup>p178</sup> ="mask-icon")	CSS <a href="#">&lt;color&gt;</a>
colorspace	<a href="#">input</a> <sup>p541</sup>	The color space of the serialized color	"limited-srgb <sup>p541</sup> "; "display-p3 <sup>p541</sup> "
cols	<a href="#">textarea</a> <sup>p582</sup>	Maximum number of characters per line	<a href="#">Valid non-negative integer</a> <sup>p77</sup> greater than zero
colspan	<a href="#">td</a> <sup>p496</sup> ; <a href="#">th</a> <sup>p496</sup>	Number of columns that the cell is to span	<a href="#">Valid non-negative integer</a> <sup>p77</sup> greater than zero
content	<a href="#">meta</a> <sup>p190</sup>	Value of the element	<a href="#">Text</a> <sup>p147</sup> *
contenteditable	<a href="#">HTML elements</a> <sup>p853</sup>	Whether the element is editable	"true"; "plaintext-only"; "false"
controls	<a href="#">audio</a> <sup>p464</sup> ; <a href="#">video</a> <sup>p464</sup>	Show user agent controls	<a href="#">Boolean attribute</a> <sup>p75</sup>
coords	<a href="#">area</a> <sup>p473</sup>	Coordinates for the shape to be created in an <a href="#">image map</a> <sup>p473</sup>	<a href="#">Valid list of floating-point numbers</a> <sup>p80</sup> *
crossorigin	<a href="#">audio</a> <sup>p417</sup> ; <a href="#">img</a> <sup>p348</sup> ; <a href="#">link</a> <sup>p179</sup> ; <a href="#">script</a> <sup>p655</sup> ; <a href="#">video</a> <sup>p417</sup>	How the element handles crossorigin requests	"anonymous <sup>p99</sup> "; "use-credentials <sup>p99</sup> "
data	<a href="#">object</a> <sup>p403</sup>	Address of the resource	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p96</sup>

Attribute	Element(s)	Description	Value
datetime	<a href="#">del</a> <sup>p339</sup> ; <a href="#">ins</a> <sup>p339</sup>	Date and (optionally) time of the change	<a href="#">Valid date string with optional time</a> <sup>p93</sup>
datetime	<a href="#">time</a> <sup>p280</sup>	Machine-readable value	<a href="#">Valid month string</a> <sup>p82</sup> , <a href="#">valid date string</a> <sup>p83</sup> , <a href="#">valid yearless date string</a> <sup>p83</sup> , <a href="#">valid time string</a> <sup>p84</sup> , <a href="#">valid local date and time string</a> <sup>p85</sup> , <a href="#">valid time-zone offset string</a> <sup>p86</sup> , <a href="#">valid global date and time string</a> <sup>p87</sup> , <a href="#">valid week string</a> <sup>p89</sup> , <a href="#">valid non-negative integer</a> <sup>p77</sup> , or <a href="#">valid duration string</a> <sup>p90</sup>
decoding	<a href="#">img</a> <sup>p348</sup>	Decoding hint to use when processing this image for presentation	<a href="#">"sync"</a> <sup>p366</sup> , <a href="#">"async"</a> <sup>p366</sup> , <a href="#">"auto"</a> <sup>p366</sup>
default	<a href="#">track</a> <sup>p413</sup>	Enable the track if no other <a href="#">text track</a> <sup>p449</sup> is more suitable	<a href="#">Boolean attribute</a> <sup>p75</sup>
defer	<a href="#">script</a> <sup>p654</sup>	Defer script execution	<a href="#">Boolean attribute</a> <sup>p75</sup>
dir	<a href="#">HTML elements</a> <sup>p160</sup>	<a href="#">The text directionality</a> <sup>p160</sup> of the element	<a href="#">"ltr"</a> <sup>p160</sup> , <a href="#">"rtl"</a> <sup>p160</sup> , <a href="#">"auto"</a> <sup>p160</sup>
dir	<a href="#">bdo</a> <sup>p298</sup>	<a href="#">The text directionality</a> <sup>p160</sup> of the element	<a href="#">"ltr"</a> <sup>p160</sup> , <a href="#">"rtl"</a> <sup>p160</sup>
dirname	<a href="#">input</a> <sup>p600</sup> ; <a href="#">textarea</a> <sup>p600</sup>	Name of form control to use for sending the element's <a href="#">directionality</a> <sup>p160</sup> in <a href="#">form submission</a> <sup>p628</sup>	<a href="#">Text</a> <sup>p147</sup> *
disabled	<a href="#">button</a> <sup>p601</sup> ; <a href="#">input</a> <sup>p601</sup> ; <a href="#">optgroup</a> <sup>p576</sup> ; <a href="#">option</a> <sup>p578</sup> ; <a href="#">select</a> <sup>p601</sup> ; <a href="#">textarea</a> <sup>p601</sup> ; <a href="#">form-associated custom elements</a> <sup>p601</sup>	Whether the form control is disabled	<a href="#">Boolean attribute</a> <sup>p75</sup>
disabled	<a href="#">fieldset</a> <sup>p594</sup>	Whether the descendant form controls, except any inside <a href="#">legend</a> <sup>p596</sup> , are disabled	<a href="#">Boolean attribute</a> <sup>p75</sup>
disabled	<a href="#">link</a> <sup>p181</sup>	Whether the link is disabled	<a href="#">Boolean attribute</a> <sup>p75</sup>
download	<a href="#">a</a> <sup>p303</sup> ; <a href="#">area</a> <sup>p303</sup>	Whether to download the resource instead of navigating to it, and its filename if so	Text
draggable	<a href="#">HTML elements</a> <sup>p885</sup>	Whether the element is draggable	<a href="#">"true"</a> ; <a href="#">"false"</a>
enctype	<a href="#">form</a> <sup>p603</sup>	<a href="#">Entry list</a> <sup>p632</sup> encoding type to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">"application/x-www-form-urlencoded"</a> <sup>p603</sup> ; <a href="#">"multipart/form-data"</a> <sup>p603</sup> ; <a href="#">"text/plain"</a> <sup>p603</sup>
enterkeyhint	<a href="#">HTML elements</a> <sup>p861</sup>	Hint for selecting an enter key action	<a href="#">"enter"</a> <sup>p861</sup> ; <a href="#">"done"</a> <sup>p861</sup> ; <a href="#">"go"</a> <sup>p861</sup> ; <a href="#">"next"</a> <sup>p862</sup> ; <a href="#">"previous"</a> <sup>p862</sup> ; <a href="#">"search"</a> <sup>p862</sup> ; <a href="#">"send"</a> <sup>p862</sup>
fetchpriority	<a href="#">img</a> <sup>p348</sup> ; <a href="#">link</a> <sup>p181</sup> ; <a href="#">script</a> <sup>p655</sup>	Sets the <a href="#">priority</a> for <a href="#">fetches</a> initiated by the element	<a href="#">"auto"</a> <sup>p103</sup> ; <a href="#">"high"</a> <sup>p103</sup> ; <a href="#">"low"</a> <sup>p103</sup>
for	<a href="#">label</a> <sup>p519</sup>	Associate the label with form control	<a href="#">ID</a> *
for	<a href="#">output</a> <sup>p585</sup>	Specifies controls from which the output was calculated	<a href="#">Unordered set of unique space-separated tokens</a> <sup>p95</sup> consisting of <a href="#">IDs</a> *
form	<a href="#">button</a> <sup>p598</sup> ; <a href="#">fieldset</a> <sup>p598</sup> ; <a href="#">input</a> <sup>p598</sup> ; <a href="#">object</a> <sup>p598</sup> ; <a href="#">output</a> <sup>p598</sup> ; <a href="#">select</a> <sup>p598</sup> ; <a href="#">textarea</a> <sup>p598</sup> ; <a href="#">form-associated custom elements</a> <sup>p598</sup>	Associates the element with a <a href="#">form</a> <sup>p514</sup> element	<a href="#">ID</a> *
formaction	<a href="#">button</a> <sup>p602</sup> ; <a href="#">input</a> <sup>p602</sup>	<a href="#">URL</a> to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p96</sup>
formenctype	<a href="#">button</a> <sup>p603</sup> ; <a href="#">input</a> <sup>p603</sup>	<a href="#">Entry list</a> <sup>p632</sup> encoding type to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">"application/x-www-form-urlencoded"</a> <sup>p603</sup> ; <a href="#">"multipart/form-data"</a> <sup>p603</sup> ; <a href="#">"text/plain"</a> <sup>p603</sup>
formmethod	<a href="#">button</a> <sup>p602</sup> ; <a href="#">input</a> <sup>p602</sup>	Variant to use for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">"GET"</a> ; <a href="#">"POST"</a> ; <a href="#">"dialog"</a>
formnovalidate	<a href="#">button</a> <sup>p603</sup> ; <a href="#">input</a> <sup>p603</sup>	Bypass form control validation for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">Boolean attribute</a> <sup>p75</sup>
formtarget	<a href="#">button</a> <sup>p603</sup> ; <a href="#">input</a> <sup>p603</sup>	<a href="#">Navigable</a> <sup>p989</sup> for <a href="#">form submission</a> <sup>p628</sup>	<a href="#">Valid navigable target name or keyword</a> <sup>p996</sup>
headers	<a href="#">td</a> <sup>p497</sup> ; <a href="#">th</a> <sup>p497</sup>	The header cells for this cell	<a href="#">Unordered set of unique space-separated tokens</a> <sup>p95</sup> consisting of <a href="#">IDs</a> *
height	<a href="#">canvas</a> <sup>p678</sup> ; <a href="#">embed</a> <sup>p477</sup> ; <a href="#">iframe</a> <sup>p477</sup> ; <a href="#">img</a> <sup>p477</sup> ; <a href="#">input</a> <sup>p477</sup> ; <a href="#">object</a> <sup>p477</sup> ; <a href="#">source</a> <sup>p477</sup> (in <a href="#">picture</a> <sup>p342</sup> );	Vertical dimension	<a href="#">Valid non-negative integer</a> <sup>p77</sup>

Attribute	Element(s)	Description	Value
	<a href="#">video</a> <sup>p477</sup>		
hidden	<a href="#">HTML elements</a> <sup>p824</sup>	Whether the element is relevant	" <a href="#">until-found</a> <sup>p824</sup> ", " <a href="#">hidden</a> <sup>p824</sup> ", the empty string
high	<a href="#">meter</a> <sup>p590</sup>	Low limit of high range	<a href="#">Valid floating-point number</a> <sup>p77</sup> *
href	<a href="#">a</a> <sup>p303</sup> ; <a href="#">area</a> <sup>p303</sup>	Address of the <a href="#">hyperlink</a> <sup>p302</sup>	<a href="#">Valid URL potentially surrounded by spaces</a> <sup>p96</sup>
href	<a href="#">link</a> <sup>p178</sup>	Address of the <a href="#">hyperlink</a> <sup>p302</sup>	<a href="#">Valid non-empty URL potentially surrounded by spaces</a> <sup>p96</sup>
href	<a href="#">base</a> <sup>p176</sup>	<a href="#">Document base URL</a> <sup>p96</sup>	<a href="#">Valid URL potentially surrounded by spaces</a> <sup>p96</sup>
hreflang	<a href="#">a</a> <sup>p303</sup> ; <a href="#">link</a> <sup>p179</sup>	Language of the linked resource	<a href="#">Valid BCP 47 language tag</a>
http-equiv	<a href="#">meta</a> <sup>p195</sup>	Pragma directive	" <a href="#">content-type</a> <sup>p195</sup> ", " <a href="#">default-style</a> <sup>p195</sup> ", " <a href="#">refresh</a> <sup>p195</sup> ", " <a href="#">x-ua-compatible</a> <sup>p195</sup> ", " <a href="#">content-security-policy</a> <sup>p195</sup> "
id	<a href="#">HTML elements</a> <sup>p154</sup>	The element's <a href="#">ID</a>	<a href="#">Text</a> <sup>p147</sup> *
imagesizes	<a href="#">link</a> <sup>p180</sup>	Image sizes for different page layouts (for <a href="#">rel</a> <sup>p178</sup> ="preload <sup>p328</sup> ")	<a href="#">Valid source size list</a> <sup>p363</sup>
imagesrcset	<a href="#">link</a> <sup>p180</sup>	Images to use in different situations, e.g., high-resolution displays, small monitors, etc. (for <a href="#">rel</a> <sup>p178</sup> ="preload <sup>p328</sup> ")	Comma-separated list of <a href="#">image candidate strings</a> <sup>p362</sup>

onbeforeinput	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">beforeinput</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onbeforematch	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">beforematch</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onbeforeprint	<a href="#">body</a> <sup>p1145</sup>	<a href="#">beforeprint</a> <sup>p1471</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onbeforeunload	<a href="#">body</a> <sup>p1145</sup>	<a href="#">beforeunload</a> <sup>p1471</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onbeforetoggle	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">beforetoggle</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onblur	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">blur</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncancel	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">cancel</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncanplay	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">canplay</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncanplaythrough	<a href="#">HTML elements</a> <sup>p1143</sup>	<a href="#">canplaythrough</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onchange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">change</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onclick	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">click</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>

Attribute	Element(s)	Description	Value
onclose	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">close</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncontextlost	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">contextlost</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncontextmenu	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">contextmenu</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncontextrestored	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">contextrestored</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncopy	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">copy</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncuechange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">cuechange</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oncut	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">cut</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondblclick	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dblclick</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondrag	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">drag</a> <sup>p884</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondragend	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dragend</a> <sup>p885</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondragenter	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dragenter</a> <sup>p884</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondragleave	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dragleave</a> <sup>p884</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondragover	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dragover</a> <sup>p884</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondragstart	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">dragstart</a> <sup>p884</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondrop	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">drop</a> <sup>p885</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ondurationchange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">durationchange</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onemptied	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">emptied</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onended	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">ended</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onerror	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">error</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onfocus	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">focus</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onformdata	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">formdata</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onhashchange	<a href="#">body</a> <sup>p1145</sup>	<a href="#">hashchange</a> <sup>p1471</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oninput	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">input</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
oninvalid	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">invalid</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onkeydown	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">keydown</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onkeypress	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">keypress</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onkeyup	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">keyup</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onlanguagechange	<a href="#">body</a> <sup>p1145</sup>	<a href="#">languagechange</a> <sup>p1471</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onload	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">load</a> <sup>p1471</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onloadeddata	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">loadeddata</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onloadedmetadata	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">loadedmetadata</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onloadstart	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">loadstart</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmessage	<a href="#">body</a> <sup>p1145</sup>	<a href="#">message</a> <sup>p1471</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmessageerror	<a href="#">body</a> <sup>p1145</sup>	<a href="#">messageerror</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmousedown	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mousedown</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmouseenter	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mouseenter</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmouseleave	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mouseleave</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmousemove	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mousemove</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmouseout	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mouseout</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmouseover	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mouseover</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onmouseup	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">mouseup</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onoffline	<a href="#">body</a> <sup>p1145</sup>	<a href="#">offline</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ononline	<a href="#">body</a> <sup>p1145</sup>	<a href="#">online</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpagehide	<a href="#">body</a> <sup>p1145</sup>	<a href="#">pagehide</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpagereveal	<a href="#">body</a> <sup>p1145</sup>	<a href="#">pagereveal</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpageshow	<a href="#">body</a> <sup>p1145</sup>	<a href="#">pageshow</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpageswap	<a href="#">body</a> <sup>p1145</sup>	<a href="#">pageswap</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpaste	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">paste</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpause	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">pause</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onplay	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">play</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onplaying	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">playing</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onpopstate	<a href="#">body</a> <sup>p1145</sup>	<a href="#">popstate</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onprogress	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">progress</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onratechange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">ratechange</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>

Attribute	Element(s)	Description	Value
onreset	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">reset</a> <sup>p1472</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onresize	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">resize</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onrejectionhandled	<a href="#">body</a> <sup>p1145</sup>	<a href="#">rejectionhandled</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onscroll	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">scroll</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onscrollend	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">scrollend</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onsecuritypolicyviolation	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">securitypolicyviolation</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onseeked	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">seeked</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onseeking	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">seeking</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onselect	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">select</a> <sup>p1472</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onslotchange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">slotchange</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onstalled	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">stalled</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onstorage	<a href="#">body</a> <sup>p1145</sup>	<a href="#">storage</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onsubmit	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">submit</a> <sup>p1472</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onsuspend	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">suspend</a> <sup>p467</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ontimeupdate	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">timeupdate</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
ontoggle	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">toggle</a> <sup>p1472</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onunhandledrejection	<a href="#">body</a> <sup>p1145</sup>	<a href="#">unhandledrejection</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onunload	<a href="#">body</a> <sup>p1145</sup>	<a href="#">unload</a> <sup>p1472</sup> event handler for <a href="#">Window</a> <sup>p922</sup> object	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onvolumechange	<a href="#">HTML elements</a> <sup>p1144</sup>	<a href="#">volumechange</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onwaiting	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">waiting</a> <sup>p468</sup> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>
onwheel	<a href="#">HTML elements</a> <sup>p1145</sup>	<a href="#">wheel</a> event handler	<a href="#">Event handler content attribute</a> <sup>p1138</sup>

## Element interfaces <sup>§ p14</sup><sub>66</sub>

*This section is non-normative.*

List of interfaces for elements	
Element(s)	Interface(s)
<a href="#">a</a> <sup>p257</sup>	<a href="#">HTMLAnchorElement</a> <sup>p258</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">abbr</a> <sup>p269</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">address</a> <sup>p222</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">area</a> <sup>p471</sup>	<a href="#">HTMLAreaElement</a> <sup>p472</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">article</a> <sup>p206</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">aside</a> <sup>p214</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">audio</a> <sup>p410</sup>	<a href="#">HTMLAudioElement</a> <sup>p411</sup> : <a href="#">HTMLMediaElement</a> <sup>p414</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">b</a> <sup>p292</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">base</a> <sup>p175</sup>	<a href="#">HTMLBaseElement</a> <sup>p175</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">bdi</a> <sup>p297</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">bdo</a> <sup>p298</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">blockquote</a> <sup>p235</sup>	<a href="#">HTMLQuoteElement</a> <sup>p235</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">body</a> <sup>p205</sup>	<a href="#">HTMLBodyElement</a> <sup>p205</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">br</a> <sup>p299</sup>	<a href="#">HTMLBRElement</a> <sup>p299</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">button</a> <sup>p566</sup>	<a href="#">HTMLButtonElement</a> <sup>p566</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">canvas</a> <sup>p677</sup>	<a href="#">HTMLCanvasElement</a> <sup>p677</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">caption</a> <sup>p486</sup>	<a href="#">HTMLTableCaptionElement</a> <sup>p486</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">cite</a> <sup>p265</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">code</a> <sup>p286</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">col</a> <sup>p488</sup>	<a href="#">HTMLTableColElement</a> <sup>p488</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">colgroup</a> <sup>p487</sup>	<a href="#">HTMLTableColElement</a> <sup>p488</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">data</a> <sup>p278</sup>	<a href="#">HTMLDataElement</a> <sup>p278</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">datalist</a> <sup>p574</sup>	<a href="#">HTMLDataListElement</a> <sup>p575</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">dd</a> <sup>p248</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">del</a> <sup>p338</sup>	<a href="#">HTMLModElement</a> <sup>p340</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>

Element(s)	Interface(s)
<a href="#">details</a> <sup>p637</sup>	<a href="#">HTMLDetailsElement</a> <sup>p637</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">dfn</a> <sup>p268</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">dialog</a> <sup>p646</sup>	<a href="#">HTMLDialogElement</a> <sup>p647</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">div</a> <sup>p256</sup>	<a href="#">HTMLDivElement</a> <sup>p256</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">dl</a> <sup>p244</sup>	<a href="#">HTMLDListElement</a> <sup>p244</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">dt</a> <sup>p247</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">em</a> <sup>p260</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">embed</a> <sup>p399</sup>	<a href="#">HTMLEmbedElement</a> <sup>p400</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">fieldset</a> <sup>p594</sup>	<a href="#">HTMLFieldSetElement</a> <sup>p594</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">figcaption</a> <sup>p252</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">figure</a> <sup>p249</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">footer</a> <sup>p220</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">form</a> <sup>p514</sup>	<a href="#">HTMLFormElement</a> <sup>p514</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h1</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h2</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h3</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h4</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h5</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">h6</a> <sup>p216</sup>	<a href="#">HTMLHeadingElement</a> <sup>p217</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">head</a> <sup>p173</sup>	<a href="#">HTMLHeadElement</a> <sup>p173</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">header</a> <sup>p218</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">hgroup</a> <sup>p218</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">hr</a> <sup>p231</sup>	<a href="#">HTMLHRElement</a> <sup>p232</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">html</a> <sup>p172</sup>	<a href="#">HTMLHtmlElement</a> <sup>p172</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">i</a> <sup>p291</sup>	<a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">iframe</a> <sup>p390</sup>	<a href="#">HTMLIFrameElement</a> <sup>p391</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">img</a> <sup>p346</sup>	<a href="#">HTMLImageElement</a> <sup>p347</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">input</a> <sup>p520</sup>	<a href="#">HTMLInputElement</a> <sup>p522</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>
<a href="#">ins</a> <sup>p337</sup>	<a href="#">HTMLModElement</a> <sup>p340</sup> : <a href="#">HTMLElement</a> <sup>p142</sup>

## Events §<sup>p14</sup> 70

*This section is non-normative.*

The following table lists events fired by this document, excluding those already defined in [media element events](#)<sup>p467</sup> and [drag-and-drop](#)

List of events			
Event	Interface	Interesting targets	Description
<b>DOMContentLoaded</b>	<a href="#">Event</a>	<a href="#">Document</a> <sup>p130</sup>	Fired at the <a href="#">Document</a> <sup>p130</sup> once the parser has finished
<b>afterprint</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> after printing
<b>beforeprint</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> before printing
<b>beforematch</b>	<a href="#">Event</a>	Elements	Fired on elements with the <a href="#">hidden=until-found</a> <sup>p824</sup> attribute before they are revealed.
<b>beforetoggle</b>	<a href="#">ToggleEvent</a> <sup>p833</sup>	Elements	Fired on elements with the <a href="#">popover</a> <sup>p886</sup> attribute when they are transitioning between showing and hidden
<b>beforeunload</b>	<a href="#">BeforeUnloadEvent</a> <sup>p983</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when the page is about to be unloaded, in case the page would like to show a warning prompt
<b>blur</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup> , elements	Fired at nodes when they stop being <a href="#">focused</a> <sup>p836</sup>
<b>cancel</b>	<a href="#">Event</a>	<a href="#">CloseWatcher</a> <sup>p867</sup> , <a href="#">dialog</a> <sup>p646</sup> elements, <a href="#">input</a> <sup>p520</sup> elements	Fired at <a href="#">CloseWatcher</a> <sup>p867</sup> objects or <a href="#">dialog</a> <sup>p646</sup> elements when they receive a <a href="#">close request</a> <sup>p863</sup> , or at <a href="#">input</a> <sup>p520</sup> elements in the <a href="#">File</a> <sup>p544</sup> state when the user does not change their selection
<b>change</b>	<a href="#">Event</a>	Form controls	Fired at controls when the user commits a value change (see also the <a href="#">input</a> event)
<b>click</b>	<a href="#">PointerEvent</a>	Elements	Normally a mouse event; also synthetically fired at an element before its <a href="#">activation behavior</a> is run, when an element is activated from a non-pointer input device (e.g. a keyboard)
<b>close</b>	<a href="#">Event</a>	<a href="#">CloseWatcher</a> <sup>p867</sup> , <a href="#">dialog</a> <sup>p646</sup> elements, <a href="#">MessagePort</a> <sup>p1205</sup>	Fired at <a href="#">CloseWatcher</a> <sup>p867</sup> objects or <a href="#">dialog</a> <sup>p646</sup> elements when they are closed via a <a href="#">close request</a> <sup>p863</sup> or via web developer code, or at <a href="#">MessagePort</a> <sup>p1205</sup> objects when <a href="#">disentangled</a> <sup>p1206</sup>
<b>connect</b>	<a href="#">MessageEvent</a> <sup>p1189</sup>	<a href="#">SharedWorkerGlobalScope</a> <sup>p1230</sup>	Fired at a shared worker's global scope when a new client connects
<b>contextlost</b>	<a href="#">Event</a>	<a href="#">canvas</a> <sup>p677</sup> elements, <a href="#">OffscreenCanvas</a> <sup>p741</sup> objects	Fired when the corresponding <a href="#">CanvasRenderingContext2D</a> <sup>p682</sup> or <a href="#">OffscreenCanvasRenderingContext2D</a> <sup>p745</sup> is lost
<b>contextrestored</b>	<a href="#">Event</a>	<a href="#">canvas</a> <sup>p677</sup> elements, <a href="#">OffscreenCanvas</a> <sup>p741</sup> objects	Fired when the corresponding <a href="#">CanvasRenderingContext2D</a> <sup>p682</sup> or <a href="#">OffscreenCanvasRenderingContext2D</a> <sup>p745</sup> is restored after being lost
<b>currententrychange</b>	<a href="#">NavigationCurrentEntryChangeEvent</a> <sup>p980</sup>	<a href="#">Navigation</a> <sup>p952</sup>	Fired when <a href="#">navigation.currentEntry</a> <sup>p958</sup> changes
<b>dispose</b>	<a href="#">Event</a>	<a href="#">NavigationHistoryEntry</a> <sup>p956</sup>	Fired when the <a href="#">session history entry</a> <sup>p1005</sup> corresponding to the <a href="#">NavigationHistoryEntry</a> <sup>p956</sup> has been permanently evicted from session history and can no longer be traversed to
<b>error</b>	<a href="#">Event</a> or <a href="#">ErrorEvent</a> <sup>p1099</sup>	Global scope objects, <a href="#">Worker</a> <sup>p1236</sup> objects, elements, networking-related objects	Fired when unexpected errors occur (e.g. networking errors, script errors, decoding errors)
<b>focus</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup> , elements	Fired at nodes <a href="#">gaining focus</a> <sup>p836</sup>
<b>formdata</b>	<a href="#">FormDataEvent</a> <sup>p636</sup>	<a href="#">form</a> <sup>p514</sup> elements	Fired at a <a href="#">form</a> <sup>p514</sup> element when it is <a href="#">constructing the entry list</a> <sup>p632</sup>
<b>hashchange</b>	<a href="#">HashChangeEvent</a> <sup>p981</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when the <a href="#">fragment</a> part of the document's <a href="#">URL</a> changes
<b>input</b>	<a href="#">Event</a>	Elements	Fired when the user changes the <a href="#">contenteditable</a> <sup>p853</sup> element's content, or the form control's value. See also the <a href="#">change</a> <sup>p1471</sup> event for form controls.
<b>invalid</b>	<a href="#">Event</a>	Form controls	Fired at controls during form validation if they do not satisfy their constraints
<b>languagechange</b>	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the user's preferred languages change
<b>load</b>	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup> , elements	Fired at the <a href="#">Window</a> <sup>p922</sup> when the document has finished loading; fired at an element containing a resource (e.g. <a href="#">img</a> <sup>p346</sup> , <a href="#">embed</a> <sup>p399</sup> ) when its resource has finished loading
<b>message</b>	<a href="#">MessageEvent</a> <sup>p1189</sup>	<a href="#">Window</a> <sup>p922</sup> , <a href="#">EventSource</a> <sup>p1191</sup> ,	Fired at an object when it receives a message

Event	Interface	Interesting targets	Description
		<a href="#">MessagePort</a> <sup>p1205</sup> , <a href="#">BroadcastChannel</a> <sup>p1209</sup> , <a href="#">DedicatedWorkerGlobalScope</a> <sup>p1230</sup> , <a href="#">Worker</a> <sup>p1236</sup> , <a href="#">ServiceWorkerContainer</a>	
messageerror	<a href="#">MessageEvent</a> <sup>p1189</sup>	<a href="#">Window</a> <sup>p922</sup> , <a href="#">MessagePort</a> <sup>p1205</sup> , <a href="#">BroadcastChannel</a> <sup>p1209</sup> , <a href="#">DedicatedWorkerGlobalScope</a> <sup>p1230</sup> , <a href="#">Worker</a> <sup>p1236</sup> , <a href="#">ServiceWorkerContainer</a>	Fired at an object when it receives a message that cannot be deserialized
navigate	<a href="#">NavigateEvent</a> <sup>p970</sup>	<a href="#">Navigation</a> <sup>p952</sup>	Fired before the <a href="#">navigable</a> <sup>p989</sup> <a href="#">navigates</a> <sup>p1014</sup> , <a href="#">reloads</a> <sup>p1027</sup> , <a href="#">traverses</a> <sup>p1028</sup> , or <a href="#">otherwise</a> <sup>p946</sup> changes its URL
navigateerror	<a href="#">ErrorEvent</a> <sup>p1099</sup>	<a href="#">Navigation</a> <sup>p952</sup>	Fired when a navigation does not complete successfully
navigatesuccess	<a href="#">Event</a>	<a href="#">Navigation</a> <sup>p952</sup>	Fired when a navigation completes successfully
offline	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the network connections fails
online	<a href="#">Event</a>	Global scope objects	Fired at the global scope object when the network connections returns
open	<a href="#">Event</a>	<a href="#">EventSource</a> <sup>p1191</sup>	Fired at <a href="#">EventSource</a> <sup>p1191</sup> objects when a connection is established
pageswap	<a href="#">PageSwapEvent</a> <sup>p982</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> right before a document is <a href="#">unloaded</a> <sup>p1064</sup> as a result of a navigation.
pagehide	<a href="#">PageTransitionEvent</a> <sup>p983</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when the page's <a href="#">session history entry</a> <sup>p1005</sup> stops being the <a href="#">active entry</a> <sup>p989</sup>
pagereveal	<a href="#">PageRevealEvent</a> <sup>p982</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when the page begins to render for the first time after it has been initialized or <a href="#">reactivated</a> <sup>p1051</sup>
pageshow	<a href="#">PageTransitionEvent</a> <sup>p983</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when the page's <a href="#">session history entry</a> <sup>p1005</sup> becomes the <a href="#">active entry</a> <sup>p989</sup>
pointercancel	<a href="#">PointerEvent</a>	Elements and <a href="#">Text</a> nodes	Fired at the <a href="#">source node</a> <sup>p880</sup> when the user attempts to initiate a drag-and-drop operation
popstate	<a href="#">PopStateEvent</a> <sup>p981</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> when in some cases of <a href="#">session history traversal</a> <sup>p1028</sup>
readystatechange	<a href="#">Event</a>	<a href="#">Document</a> <sup>p130</sup>	Fired at the <a href="#">Document</a> <sup>p130</sup> when it finishes parsing and again when all its subresources have finished loading
rejectionhandled	<a href="#">PromiseRejectionEvent</a> <sup>p1100</sup>	Global scope objects	Fired at global scope objects when a previously-unhandled promise rejection becomes handled
reset	<a href="#">Event</a>	<a href="#">form</a> <sup>p514</sup> elements	Fired at a <a href="#">form</a> <sup>p514</sup> element when it is <a href="#">reset</a> <sup>p637</sup>
select	<a href="#">Event</a>	Form controls	Fired at form controls when their text selection is adjusted (whether by an API or by the user)
storage	<a href="#">StorageEvent</a> <sup>p1255</sup>	<a href="#">Window</a> <sup>p922</sup>	Fired at <a href="#">Window</a> <sup>p922</sup> event when the corresponding <a href="#">localStorage</a> <sup>p1255</sup> or <a href="#">sessionStorage</a> <sup>p1254</sup> storage areas change
submit	<a href="#">SubmitEvent</a> <sup>p636</sup>	<a href="#">form</a> <sup>p514</sup> elements	Fired at a <a href="#">form</a> <sup>p514</sup> element when it is <a href="#">submitted</a> <sup>p629</sup>
toggle	<a href="#">ToggleEvent</a> <sup>p833</sup>	<a href="#">details</a> <sup>p637</sup> and <a href="#">popover</a> <sup>p886</sup> elements	Fired at <a href="#">details</a> <sup>p637</sup> elements when they open or close; fired on elements with the <a href="#">popover</a> <sup>p886</sup> attribute when they are transitioning between showing and hidden
unhandledrejection	<a href="#">PromiseRejectionEvent</a> <sup>p1100</sup>	Global scope objects	Fired at global scope objects when a promise rejection goes unhandled
unload	<a href="#">Event</a>	<a href="#">Window</a> <sup>p922</sup>	Fired at the <a href="#">Window</a> <sup>p922</sup> object when the page is going away
visibilitychange	<a href="#">Event</a>	<a href="#">Document</a> <sup>p130</sup>	Fired at the <a href="#">Document</a> <sup>p130</sup> object when the page becomes visible or hidden to the user

## HTTP headers §<sup>p14</sup><sub>72</sub>

This section is non-normative.

The following HTTP request headers are defined by this specification:

- ``Last-Event-ID`p1194`
- ``Ping-From`p313`
- ``Ping-To`p313`

The following HTTP response headers are defined by this specification:

- ``Cross-Origin-Embedder-Policy`p913`
- ``Cross-Origin-Embedder-Policy-Report-Only`p913`
- ``Cross-Origin-Opener-Policy`p904`
- ``Cross-Origin-Opener-Policy-Report-Only`p904`
- ``Origin-Agent-Cluster`p902`
- ``Refresh`p1069`
- ``X-Frame-Options`p1068`

## MIME types <sup>p14</sup><sub>73</sub>

*This section is non-normative.*

The following MIME types are mentioned in this specification:

### **application/atom+xml**

Atom [\[ATOM\]](#)<sup>p1475</sup>

### **application/json**

JSON [\[JSON\]](#)<sup>p1479</sup>

### **application/octet-stream**

Generic binary data [\[RFC2046\]](#)<sup>p1481</sup>

### **application/microdata+json**<sup>p1448</sup>

Microdata as JSON

### **application/rss+xml**

RSS

### **application/wasm**

WebAssembly [\[WASM\]](#)<sup>p1483</sup>

### **application/x-www-form-urlencoded**

Form submission

### **application/xhtml+xml**<sup>p1446</sup>

HTML

### **application/xml**

XML [\[XML\]](#)<sup>p1484</sup> [\[RFC7303\]](#)<sup>p1482</sup>

### **image/gif**

GIF images [\[GIF\]](#)<sup>p1478</sup>

### **image/jpeg**

JPEG images [\[JPEG\]](#)<sup>p1479</sup>

### **image/png**

PNG images [\[PNG\]](#)<sup>p1481</sup>

### **image/svg+xml**

SVG images [\[SVG\]](#)<sup>p1482</sup>

### **multipart/form-data**

Form submission [\[RFC7578\]](#)<sup>p1482</sup>

### **multipart/mixed**

Generic mixed content [\[RFC2046\]](#)<sup>p1481</sup>

### **multipart/x-mixed-replace**<sup>p1445</sup>

Streaming server push

### **text/css**

CSS [\[CSS\]](#)<sup>p1476</sup>

### **text/event-stream**<sup>p1449</sup>

Server-sent event streams

### **text/javascript**

JavaScript [\[JAVASCRIPT\]](#)<sup>p1479</sup> [\[RFC9239\]](#)<sup>p1481</sup>

### **text/json**

JSON (legacy type)

### **text/plain**

Generic plain text [\[RFC2046\]](#)<sup>p1481</sup> [\[RFC3676\]](#)<sup>p1481</sup>

### **text/html**<sup>p1444</sup>

HTML

### **text/ping**<sup>p1447</sup>

Hyperlink auditing

### **text/uri-list**

List of URLs [\[RFC2483\]](#)<sup>p1481</sup>

### **text/vcard**

vCard [\[RFC6350\]](#)<sup>p1481</sup>

### **text/vtt**

WebVTT [\[WEBVTT\]](#)<sup>p1484</sup>

### **text/xml**

XML [\[XML\]](#)<sup>p1484</sup> [\[RFC7303\]](#)<sup>p1482</sup>

### **video/mp4**

MPEG-4 video [\[RFC4337\]](#)<sup>p1481</sup>

### **video/mpeg**

MPEG video [\[RFC2046\]](#)<sup>p1481</sup>

Andersen, for their useful comments, both large and small, that have led to changes to this specification over the years.

Thanks also to everyone who has ever posted about HTML to their blogs, public mailing lists, or forums, including all the contributors to the [various W3C HTML WG lists](#) and the [various WHATWG lists](#).

Special thanks to Richard Williamson for creating the first implementation of [canvas](#)<sup>p677</sup> in Safari, from which the canvas feature was designed.

Special thanks also to the Microsoft employees who first implemented the event-based drag-and-drop mechanism, [contenteditable](#)<sup>p853</sup>, and other features first widely deployed by the Windows Internet Explorer browser.

Special thanks and \$10,000 to David Hyatt who came up with a broken implementation of the [adoption agency algorithm](#)<sup>p1340</sup> that the editor had to reverse engineer and fix before using it in the parsing section.

Thanks to the participants of the microdata usability study for allowing us to use their mistakes as a guide for designing the microdata feature.

Thanks to the many sources that provided inspiration for the examples used in the specification.

Thanks also to the Microsoft blogging community for some ideas, to the attendees of the W3C Workshop on Web Applications and Compound Documents for inspiration, to the #mrt crew, the #mrt.no crew, and the #whatwg crew, and to Pillar and Hedral for their ideas and support.

Thanks to Igor Zhbanov for generating PDF versions of the specification.

Special thanks to the [RICG](#) for developing the [picture](#)<sup>p342</sup> element and related features; in particular thanks to Adrian Bateman, Bruce Lawson, David Newton, Ilya Grigorik, John Schoenick, Leon de Rijke, Mat Marquis, Marcos Cáceres, Tab Atkins, Theresa O'Connor, and Yoav Weiss for their contributions.

Special thanks to the [WPWG](#) for incubating the [custom elements](#)<sup>p749</sup> feature. In particular, thanks to David Hyatt and Ian Hickson for their influence through the XBL specifications, Dimitri Glazkov for the first draft of the custom elements specification, and to Alex Komoroske, Alex Russell, Andres Rios, Boris Zbarsky, Brian Kardell, Daniel Buchner, Dominic Cooney, Erik Arvidsson, Elliott Sprehn, Hajime Morrita, Hayato Ito, Jan Miksovsky, Jonas Sicking, Olli Pettay, Rafael Weinstein, Roland Steiner, Ryosuke Niwa, Scott Miles, Steve Faulkner, Steve Orvell, Tab Atkins, Theresa O'Connor, Tim Perry, and William Chen for their contributions.

Special thanks to the [CSSWG](#) for developing the [worklets](#)<sup>p1242</sup>. In particular, thanks to Ian Kilpatrick for his work as editor of the original worklets specification.

For about ten years starting in 2003, this standard was almost entirely written by Ian Hickson ([Google](#), [ian@hixie.ch](mailto:ian@hixie.ch)).

Starting in 2015, the editor group expanded. It is currently maintained by [Anne van Kesteren](#) ([Apple](#), [annevk@annevk.nl](mailto:annevk@annevk.nl)), [Domenic Denicola](#) ([Google](#), [d@domenic.me](mailto:d@domenic.me)), [Dominic Farolino](#) ([Google](#), [domfarolino@gmail.com](mailto:domfarolino@gmail.com)), [Philip Jägenstedt](#) ([Google](#), [philip@foolip.org](mailto:philip@foolip.org)), and Simon Pieters ([Mozilla](#), [zcorpan@gmail.com](mailto:zcorpan@gmail.com)).
